ALMANACK, a calendar, or book, in which the revolutions of the seasons ; the rising and setting of the sun ; the phases of the moon ; the most remarkable conjunctions, positions, and phenomena of the heavenly bodies are marked down for every month and day in the year ; also the several feasts and fasts to be observed in the church and state ; together with the common ecclesiastical notes, &c. Some derive the etymology of the word from the Arabic particle *al* and *manach*, to count ; others from *al* and *muavakoc*, the course of months. Golius thinks it derived from a custom prevailing throughout the East, for all subjects, at the beginning of the year, to make presents to their princes. He observes that the astrologers, among the rest, present him with their ephemerides for the new year, called *alman-ha*, or new-year’s gifts. Verstegan and others write the word *Almonat*, and consider it of German origin. Not a few derive it from the Teutonic *al* and *maan*, the moon, or an account of every moon or every month, so our ancestors, observes Verstegan, used to carve the courses of the moon for the year upon a square piece of wood, which they called *almonaught*, signifying in old English, or Saxon *ALL-MOON-HEED*. With respect to the opinion of Golius, Murza Ja à far, a gentleman belonging to the court of the prince of Persia, and a native of great intelligence and veracity, assures us, that though the custom still remains, yet neither the Persians nor the Arabians have any such word in their language as *almanha*. He has also favoured us with the inspection and explanation of a Persian almanack, which is no ordinary curiosity. The first page contains a list of fortunate days for certain purposes, as for example, for buying, for selling, for marrying, for taking medicine, &c. ; after which follow predictions of events, as earthquakes, storms, political occurrences, &c., after the manner of Moore’s Almanack, occupying only one page. Then begins the calendar arranged much after the manner of our almanacks, in which the days of the month and of the week are arranged from the top of the page downwards. The second column exhibits the rising and setting of the sun, and the seven succeeding ones the distance of the sun from the six primary planets, according to their imperfect notions of astronomy, the Moon, Mercury, Venus, Mars, Jupiter, and Saturn. The next page contains the days of the month repeated, with columns of the distance of the moon from the other planets. The column next succeeding shews the time of her coming upon the meridian both above and below the horizon, commonly called the zenith and nadir ; and the right hand column is an entire register of the several feasts and remarkable

events connected with the Mahomedan religion. The last two pages contain a scheme of the configuration of the planets, the calculation of eclipses, &c., formed upon the Ptolemaic system ; and as the system is erroneous, the calculations are extremely imperfect. The Persian almanacks, according to this example of them, greatly correspond with the genius of the nation, who are much addicted to astrology and astronomy, to which a pastoral life, perhaps, inclines them, and also furnishes them leisure to apply themselves. To the present time they neither sow nor reap, plant, travel, buy, sell, nor undertake any expedition without consulting first of all the stars and almanacks. There are astrological rules for doing any thing, bleeding, purging, &c., down to the cutting of the hair, and paring of the nails. In this kingdom and in many states of Europe we have almanacks of various descriptions, both in pamphlets and sheets ; some of them annual and some perpetual. The primary subject of our almanacks are the calendar of months, weeks, and days ; the motions, changes, and phases of the moon, to which are added astronomical, astrological, meteorological, chronological, political, medical, and rural parerga, &c. ; calculations of eclipses, solar ingresses, prognostics of the weather, table of tides and terms, lists of princes, nobility, posts, offices, dignities, public institutes, &c. The modern almanack answers, in a word, to the *fasti* of the ancient Romans. In France, however, the astrological observations are expunged by an edict promulgated by Henry III ; and so little encouragement is given to them generally, that they are at the present time confined to one or two of these publications. The first almanack is said to have been printed at Constantinople in 1716, under the direction of Abdonaham. Regiomontanus was the first in Europe who made a complete revision in the plan of almanacks, and reduced them to their present form, with the exception of their predictive observations, which have been in all probability introduced into Europe from the Persians. The utility of almanacks cannot for a moment be doubted ; and though they appear abstruse and difficult, yet by the help of good astronomical tables they are very easily made.

The most popular almanacks of the present day, are Poor Robin’s Almanack, which commenced in 1652 ; the Lady’s Diary, which appeared first in 1705 ; Season on the Seasons, which began in 1735 ; the Gentleman’s Diary, first printed in 1741 ; Moore’s Almanack ; Partridge’s Almanack ; White’s Ephemeris, or Celestial Atlas ; Goldsmith’s Almanack, and Rider’s Pocket Almanack.

The Lady’s and Gentleman’s Diary, have, in a remarkable degree, subserved the culture of the mathematical sciences in this kingdom.—All learned foreigners aver, that there is a greater proportion of our population acquainted to a certain extent with mathematical science and knowledge, than of any other country in Europe, and perhaps of the world ; and this circumstance is chiefly owing to the extensive circulation and influence of the two publications already mentioned. The proposing or so great a variety of questions

in every stage of advancement, from the first and most easy to the most remote and difficult to be answered. The succeeding year is well calculated to excite emulation among the younger branches of society, who, drawn insensibly to the consideration of the subject, are delighted by new truths, arising out of the plainest principles. The observer becomes an amateur, and the amateur a proficient. Many eminent mathematicians of the last century, as Simpson, Emerson, Lan-den, Wildbore, and other satellites, by the diffusion of whose light posterity shall discover truth, began with expounding the different axioms and positions laid down in the above publications.

The almanack, included in the book of Common Prayer, forms a part of the law of England, of which the courts must take notice in the return of writs, &c. It is in short a perpetual almanack, but will require frequent revision, being founded on the Gregorian calendar, which supposes 365 days, 5h. 49', 12", in the year; whereas its true duration of time is 365 days, 5h. 48'. 45 $\frac{1}{2}$ ". Another important publication is the Nautical Almanack, published annually under the direction of the Board of Longitude, two or three years in advance. In addition to all the essential parts of other almanacks, this contains a great variety of particulars generally interesting, although especially adapted to nautical purposes. It particularizes the distances of the moon from the sun, and from the most important fixed stars for every three hours of apparent time, according to the meridian of the Royal Observatory, Greenwich. By comparing these with the distances carefully observed at sea, the mariner may readily infer his longitude, and by having immediate recourse to Mayer's Lunar Tables, avoid the trouble and uncertainty of many intricate calculations. The sun's longitude, formerly computed from Mayer's Tables, printed in 1770, under the inspection of Dr. Maskelyne, late astronomer royal, to whom the almanack itself owes its origin, has been rendered more accurate by the additional tables of Delambre, as improved by professor Vince; and since the year 1791, the phases of the sun and moon have been both inserted.

In the almanack of 1803 the latitudes and longitudes are connected, and the moon's distance from them ascertained, according to Taylor's valuable tables, to every second of the quadrant. Since 1780, the calculations have been made from Lalande's Tables, as exhibited in the second edition of his Astronomy; and those of the eclipses of Jupiter's satellites, till the year 1795, from both Lalande's tables and Wargentine's (with the exception of the second satellite), computed by new tables of Wargentine, found in the Nautical Almanack for 1779. The eclipses have, however, from 1793, been computed to mean time from the new tables of Delambre, subjoined to the third edition of Lalande's Astronomy. Many valuable papers have appeared in this publication, adapted to facilitate nautical calculations generally. One of the most conspicuous is the rule laid down by Brinkley in 1819, for clearing the lunar distance. From the commencement of this valuable work, down

to the death of its institutor and conductor, great accuracy was observed. Since that event, numerous errors have been detected, calculated to render the publication not only useless, but injurious. At length the subject was brought before parliament—the board of longitude remodelled, and the Almanack submitted to the care of a secretary. It is hoped that no interest will prevail with the British government to place any individual in that situation who is not duly qualified.

The French have a similar publication to our Nautical Almanack, which they call *Connaissance des Temps*. It commenced in the year 1698; and though subject to slight alterations, and occasionally discontinued, it has for many years been conducted with great regularity and accuracy. There are, in this work, many valuable speculations on mathematical subjects, which greatly heighten its practical importance. A minute history of the work is given in the Almanack for 1808.

ALMANACKS, WOODEN. Antiquaries give the name of Almanacks also to a kind of instrument, usually of wood, inscribed with various figures and Runic characters, and representing the order of the feasts, dominical letters, days of the week, and golden number, with other matters necessary to be known throughout the year; used by the ancient northern nations, in their computations of time, both civil and ecclesiastical. Almanacks of this kind are known by various names among the different nations wherein they have been used; as rinstocks, primstaries, runstocks, run-staffs, Scipiones Runici, Bacculi Annales, clogs, &c. They appear to have been used only by the Swedes, Danes, and Norwegians. From the second of these people, their use was introduced into England, whence divers remains of them in the counties. Dr. Plot has given the description and figure of one of these clogs, found in Staffordshire, under the title of the Perpetual Staffordshire Almanack. The external figure and matter of these calendars appear to have been various. Sometimes they were cut on one or more wooden leaves, bound together after the manner of books; sometimes on the sealbards of swords, or even on daggers; sometimes on tools and implements, as portable steelyards, hammers, the helves of hatchets, fmails, &c. Sometimes they were made of brass or horn: sometimes of the skins of eels, which, being drawn over a stick properly inscribed, retained the impressions of it. But the most usual form was that of walking staves or sticks, which they carried about with them to church, market, &c. Each of these staves is divided into three regions; whereof the first indicates the sigis, the second the days of the week and year, and the third the golden number. The characters engraven on them are, in some, the ancient Runic; in others, the later Gothic characters of Ulsius. The saints' days are expressed in hieroglyphics, significative either of some endowment of the saint, the manner of his martyrdom, or the like. Thus, against the notch for the first of March, or St. David's day, is represented a harp; against the twenty-fifth of October, or Crispian's day, a pair of shoes; against the tenth of August, or St. Lawrence's

day, a gridiron; and, lastly, against new-year's day, a horn, the mark of good drinking, which our ancestors gave a loose to at that season.

ALMANACKS, method of constructing. The first thing to be done is, to compute the place of the sun and moon for each day of the year, or it may be taken from some ephemerides and entered into the almanack; next, find the dominical letter, and, by means thereof, distribute the calendar into weeks; then, having computed the time of Easter, by it fix the other moveable feasts; adding the immovable ones, with the names of the martyrs, the rising and setting of each luminary, the length of day and night, the aspects of the planets, the phases of the moon, and the sun's entrance into the cardinal point of the ecliptic, i. e. the two equinoxes and solstices.

ALMANAR, in the Arabian astrology, the pre-eminence of one planet over another.

ALMAND, a river of Athol, Scotland, which runs into the Tay. It has a cascade near thirty yards high; not far from which two rocks meet across the river, in such a manner as to form a natural bridge.

ALMAND CATHARTICA, in botany, plant of Surinam, supposed by the inhabitants to be good for the colic.

ALMANDINE, in mineralogy, a coarse sort of ruby, approaching in colour nearer to the granite than the ruby. It takes its name from Alabanda, a city of Caria, whence Pliny says it was brought.

ALMANASOR, (Jacob,) a caliph of the Saracens in Africa, who, after conquering territories to the extent of above 1200 leagues in length, and 180 in breadth, including the whole country from Messa to Tripoli, at last met with such a reverse of fortune, that, to save his life, he fled to Alexandria, where he commenced baker, and died in that honest profession, A. D. 1205.

ALMANZA, a small town of New Castile, on the frontiers of Valencia in Spain, rendered memorable by the defeat of the allies in 1707, under the marquis de las Minas, and the earl of Galway. It stands in a fertile plain, on the frontiers of Valencia, thirty-five miles south-west of Xativa, and sixty-two north of Murcia.

ALMANZOR the Victorious, the caliph of the house of Al Abas, succeeded his brother Abul Abbas Al Saffa, in the year 753. During his reign the city of Bagdad was raised from the foundation, and became the imperial residence. He was opposed by his uncle Abdalla-ebn-Alli, who was defeated by Almanzor's general, Abu-Moslem. Fearing this general's abilities and popularity, he caused him to be assassinated. Several insurrections took place in his reign, which were all suppressed. He died on a pilgrimage to Mecca, in the sixty-third year of his age.

ALMARHHA, a sea-port of Arabia, near the northern extremity of the Red Sea, two miles east of Cape Almarhha.

ALMARHHA, CAPE, a cape on the west coast of Arabia, in the Red Sea, forming the southern extremity of port Firaoun. Lon. 33°. 3'. 40". E. lat. 29°. 1'. 41". N.

ALME, or ALMA, singing and dancing girls

in Egypt and Hindostan, who, like the Italian improvisatori, can occasionally pour forth unpremeditated verse. They are called almé, from having received a better education than other women; and form a celebrated society in Egypt. To be received into it, according to M. Savary, it is necessary to have a good voice, to understand the language well, to know the rules of poetry, and be able to compose and sing complets impromptu. The almé know by heart all the new songs. Their memory is furnished with the most beautiful tales. There is no festival without them; no entertainment of which they do not constitute the ornament. They are placed in a rostrum, from whence they sing during the repast. They then descend into the saloon, and form dances which have no resemblance to ours. They are pantomime ballets, in which they represent the usual occurrences of life. The suppleness of their bodies is inconceivable, as well as the mobility of their features, to which they give at pleasure the impress suited to the characters they play. Frequently, however, they lay aside, with their veils, the modesty of their sex. They are the modern Bacchants in a delirium. It is then that a people, far from delicate, redouble their applauses. These almé are sent for into all the harems. They teach the women the new airs, amuse them with amorous tales, and recite in their presence poems, which contain lively pictures of oriental manners. The common people have also their almé of a secondary order.

ALMEDINA, a decayed town of Morocco, a declivity of mount Atlas. The country around it is very fertile.

ALMEHRAB, among the Mahomedans, denotes a niche in their mosques, which directs to the kebla, or temple of Mecca, to which they are obliged to bow in praying. See KEBLA.

ALMEIDA, a frontier town of Portugal, in the province of Tralos Montes, on the confines of Leon, where there was a very brisk action between the French and Portuguese in 1663; seventeen miles north-west of Ciudad Rodrigo.

ALMEIDA, a fortified town of Portugal, in Beira, on the Spanish frontier, containing about 2500 inhabitants and two parishes. It is 113 miles north-east of Lisbon. This place was taken by the French in 1810, and retaken by the British at the beginning of the following year.

ALMEIDA, (Francis,) a Portuguese gentleman, appointed in 1505 the first viceroy of India. He took the city of Quilao, and made many other conquests. Being informed that a rich Arabian fleet lay in the harbour of Panama, he proceeded thither with his squadron, and found the ships protected by a rampart and a strong garrison. Almeida, however, ventured to land, and, after an obstinate conflict, defeated the enemy, and set the city and ships on fire. On the death of his son, who was killed in a severe engagement, Almeida only said, 'he thanked God for having honoured him with so glorious a death.' While he was thus engaged, Albuquerque received orders from Portugal to supersede him, but Almeida being about to proceed to Dabul with a fleet, refused to deliver up his government. In this expedition he sullied his reputation

putting all the inhabitants of the city to the sword, and not sparing even the infants. He afterwards fell in with the fleet of the enemy, and defeated it, making a slaughter of 4000 men. This produced a peace. On his passage to Europe he was slain at the Cape of Good Hope, in a skirmish with the natives.

ALMELILETU is used, by Avicenna, to express a preternatural kind of heat, a degree less than that of a fever.

ALMELOO, a small town and lordship of Overyssel, Holland, district of Twenthe, belonging to the count of Rechteren. It had 2162 inhabitants in 1796, and carried on a considerable trade in the linen which is here manufactured. Twenty miles east-north-east of Deventer.

ALMELOVEEN (Theodore Jansen Van), a physician, was born in 1657, at Medrecht, near Utrecht, and died in 1712. Among his works are, 1. Hippocratis Aphorismi, Gr. et Lat. 12mo. Amst. 1685. 2. Aurelius Celsus de Medicina, 12mo. Amst. 1687; 8vo. 1713; 8vo. Patav. 1722. 3. Apicci Cælii de Obsoniis et Condimentis, sive de Arte Coquinaria, Libri x. 8vo. Amst. 1709. 4. Aurelianus de Morbis Acutis et Chronicis, 4to. Amst. 1709. 5. Bibliotheca Promissa et Latens, 8vo. 1688, 1698, 12mo. 1692; 8vo. Nuremberg, 1699. 6. The Anatomy of the Muscle, 8vo. Amst. 1684. 7. Onomasticon Rerum Inventarum et Inventa Nova et Antiqua, id est Brevis Enarratio Ortus et Progressus Artis Medicae, ibid. 1684. 8. Fasti Consulares, 8vo. Amster. 1705. As he had no children, he left his collection of the different editions of Quintilian to the University at Utrecht. His library, which was extensive, was sold the following year at Amsterdam.

ALMENDVALAO, a town of Spanish Extremadura, near the borders of Portugal.

ALMENE, in botany, a name given by some of the Arabian writers to the prickly lotus of Africa, called by the ancients lotus acanthos, and by Virgil acanthus only.

ALMENE, in commerce, a weight of two pounds used to weigh saffron in several parts of the continent of the East Indies.

ALMERIA, a river of Spain, on the mouth of which is seated the town of that name. See next article.

ALMERIA, a sea-port town of Granada, in Spain, pleasantly situated in a fine bay on the Mediterranean. This town is by some thought to have risen from the ruins of the ancient Abdæra, and was formerly a place of great consequence. It was taken from the Moors in 1147, by the Emperor Conrad III. in conjunction with the French, Genoese, and Pisans; being at that time the strongest place in Spain held by the infidels, from which their privateers, which were exceedingly numerous, gave equal disturbance to the maritime provinces of Spain, France, Italy, and the adjacent islands. The city being well fortified and provisioned, having a strong castle, and a numerous garrison, was at last taken by storm, and upon its reduction was made a bishopric, suffragan of Granada. The harbour is commodious and well sheltered, and the castle yet remains. It is forty-five miles south of Baza,

and fifty-four south-east of Granada. Long. 2°. 41'. W. lat. 36°. 50' N.

ALMERIA, a sea-port town of Mexico, in the province of Vera Cruz; on the coast, and near the river Noadan. It is fifty miles north of Vera Cruz, and 150 east of Mexico. Long. 97°. 30'. W. lat. 20°. 18' N.

ALMERICIANS, in ecclesiastical history, a short lived sect of the thirteenth century, who insisted that the power of each of the persons of the Holy Trinity commenced at certain periods of time. That of the Father was, according to their creed, restricted to the Mosaic dispensation, that of the Son reached to the beginning of the thirteenth century, and the reign of the Holy Ghost then commencing, all the ceremonies of external worship were to be discontinued.

ALMESFEOH, alms money, or Peter pence, a tribute formerly paid in England to the pope, on the eighth of August.

ALMIGGIM WOOD, a word used in the scriptures to signify a beautiful and light sort of wood, used for musical instruments. Meibomius proves, that it was the Indian pine or fir tree.

ALMIGHTY, *adj.* { All might. Having ALMIGHTINESS. } all might or power.

Greete and wunderful ben thi werkis, Lord God Almighty, the weies ben iust and trewe Lord kyng of worldis. *Wielis's Apocalyp.* c. xv.

It serveth to the world, for a witness of his almighty, whom we outwardly honour with the chiefeſt of outward things. *Hooker.*

In creating and making existent the world universal, by the absolute act of his own word, God shewed his power and almighty. *Sir Walter Raleigh.*

In the wilderness, the bittern and the stork, the unicorn and elk, live upon his provisions, and reverence his power, and feel the force of his almighty. *Taylor.*

The Lord appeared unto Abraham; and said unto him, I am the almighty God: walk before me, and be thou perfect. *Genesis, xvii. 1.*

Th' infernal serpent! he it was whose guile Stirred up with envy and revenge deceived The mother of mankind.

Him th' almighty power Hurl'd headlong flaming from the ethereal sky, With hideous ruin and combustion down To bottomless perdition. *Milton.*

ALMIRANTE, a river of the province of Florida, which runs south-east, and falls into the sea in the bay of Pensacola.

ALMIRANTE BAY, a bay of South America, on the coast of Veraguas, and kingdom of Terra Firme, so called from its having been discovered by Columbus in his fourth voyage. He was nearly wrecked at its entrance.

ALMISSA, a strong town and district in Venetian Dalmatia, anciently called Peguntium; seated on the mouth of the Cetina, between two high mountains, on a steep rock inaccessible to shipping. It lies ten miles east of Spalatro, directly opposite to the isle of Brassa. Long. 39°. 33'. E. Lat. 43°. 56' N.

ALMIZADIR, among alchemists, is sometimes used for verdigris; sometimes for the process of the philosopher's stone; and sometimes for the aqua mercurialis, or aqua philosophorum.

ALMO, in ancient history, a rivulet of Cam-

pagna, falling into the Tiber at Rome; now called Rio d'Appio. On the 25th of March, the image of Cybele, and whatever was consecrated to her was washed in this river.

*Est locus in Tiberim quo lubricus infuit Almo,
Et nomen magno perdit ab amne minor;
Illic purpurea canus cum veste sacerdos
Almonis dominam, sacraque lavit aquisi.*

Ovid. Fast. l. 4. v. 387.

ALMODAVAR, a small town of Alentejo, Portugal, having 1800 inhabitants. It is nine miles south of Ourique.

ALMODAVAR DEL CAMPO, a handsome town of New Castile, Spain, with a castle, and containing 3000 inhabitants. It is eighteen miles south of Cividad Real, and included in the district of that name.

ALMOHIARAM, the first month of the ancient Arabs.

ALMOHEDES, in history, the name of an African dynasty which succeeded that of the Almoravides, in Barbary, in the commencement of the twelfth century. It took its rise in the reign of Al Abraham, or Brahem, and derived its name from an obscure founder, a Barber, of the tribe of Muzamada, originally named Abdallah. In order to secure success to the design he had conceived, he assumed the title of Mohdi, or Mohedi, and set up for the head of leader of the orthodox, who were now become so numerous by his preaching, that he presumed to bid defiance even to his sovereign. Their unexpected increase at last alarmed him, and he prepared for subduing them. His force, however, was insufficient for the purpose, and in his first engagement he was totally defeated. Abdallah was wary, and secured the capital; so that Brahem, pursued as a fugitive by Abdalmumen, one of the party, was obliged to seek refuge in the city of Fez. But the gates of the city were not only shut against him, but opened to receive his pursuers. The next place to which this prince repaired was Auran, or Oran; but that city was soon invested by Abdalmumen, and the magistrates, unable to defend themselves, and dreading the consequences of an hostile attack, urged him to leave the town. Under the shelter of a dark night, he, with his favourite wife on horseback behind him, set out from Oran, but being discovered and pursued, he spurred the animal in a fit of despair, and leaped down a precipice, where he and his wife were dashed to pieces. The fatal end of this prince put a period to the empire of the Almoravides. As soon as Abdalmumen, vulgarly called Abdalman, was apprised of Brahem's death, he traversed the kingdom of Tremeçen in his way to Morocco, where, Abdallah being dead, he was declared his successor by the chiefs of the party, and proclaimed king of the Almohedes, under the title of Al Emir Al Mumin Abdallah Mohammed Abdal Mumen Ebn Abdallah Ibni Ali, i. e. chief or emperor of the true believers of the house of Mohammed Abdal Mumen, the son of Abdal Mumen, the son of Abdallah of the lineage of Ali. Abdallah had appointed a council of forty disciples of his sect, all of whom were preachers; some were commissioned to regulate all public affairs, and at proper seasons to itinerate in the country, and

others to the number of sixteen, were to act as secretaries. From the former of these two classes the successors to the regal and pontifical throne were to be elected. The disciples of this sect were by the Arabian writers styled only preachers, and by the Spanish Al Mohedes; but the descendants and successors of that tribe continued to retain the appellation of Emir Al Mumenin, or chiefs of the faithful or true believers, as long as their dynasty lasted.

ALMOIN, in law. See FRANK-ALMOIN.

ALMON (John), a political writer, born at Liverpool in 1738. After serving his apprenticeship to a bookseller, he went to sea, and in 1759 settled in London. On the death of George the Second, he published a Review of his reign, which went through two editions. His next piece was a review of the administration of Mr. Pitt, which gained him the patronage of Lord Temple. In 1765 he opened a shop in Piccadilly, but his success, however, in trade was not adequate to his activity, and he was obliged to give up the bookselling business. He died in 1805. His principal publications were—1. Anecdotes of Lord Chatham, 3 vols. 8vo. 2. Biographical Anecdotes of Eminent Persons, 3 vols. 8vo. 3. An edition of Junius, 2 vols., in which he attempted to prove, that Hugh Boyd was the author of those celebrated letters.—*Gen. Biog. Dict.*

ALMOND, a river in Perthshire, which rises in Glenalmond, and falls into the Tay, a little above Perth.

ALMOND, in botany. See AMYGDALUS.

ALMOND, in commerce, a measure by which the Portuguese sell their oil; twenty-six almonds make a pipe. Almonds, the fruit, are also used instead of a small money, in several parts of the East Indies; particularly where the cowries, those small shells which come from the Maldives, are not current.

ALMONS, in anatomy, a name for the glandular substances, otherwise called tonsilla, on each side the uvula at the root of the tongue.

ALMOND-STONE, in mineralogy, the amygdalites of Linnaeus, a sort of stones consisting of glandules resembling the almond in shape.

ALMONDBURY, a small town of England, in the West Riding of Yorkshire, about a mile from Huddersfield, on the river Calder. It is said to have been the Campodonum of the Romans, and the residence of some of the Saxon kings. But Dr. Whittaker disputes the former. The vestiges of a castle are still perceptible on a neighbouring hill. Population 4613. Distant 186 miles from London.

ALMONER, in its primitive sense, denoted an officer in religious houses to whom belonged the management and distribution of the alms of the house. By the ancient canons, all monasteries were to spend at least a tenth part of their income in alms to the poor. The almoner of St. Paul's was to dispose of the monies left for charity, according to the appointment of the donors, to bury the poor who died in the neighbourhood, and to breed up eight boys in singing, for the use of the choir. By an ancient canon, all bishops are required to keep almoners. The Greek almoner, (*le grand aumonier*) of France, was the

highest ecclesiastical dignity in that kingdom, before the revolution. To him belonged the superintendency of all hospitals and houses of lepers. The king received the sacrament from his hand; and he said mass at all grand solemnities. Almoner is also a fashionable title given by some writers to chaplains. In this sense we meet with almoner of a ship, almoner of a regiment, &c.

ALMONER, Lord, or Lord High Almoner, of England, is an ecclesiastical officer, generally a bishop, who had formerly the forfeiture of all debts, and the goods of felos de se, which he was to distribute among the poor. He had also the power of giving the first dish from the king's table to whatever poor person he pleased.

ALMORA, a garrison town in northern Hindostan, situated in the district of that name, of which it is the capital, as well as of Kemaon. The district is hilly, covered with impervious forests and jungles, and thinly peopled. It is a subdivision of Kemaon, the whole being tributary to the Goorkali rajah of Nepaul. The town is built on the top of a ridge of mountains, the thinly scattered houses extending down the slope on each side. It is said to be more extensive and populous than Serinagur, and a place of greater traffic, but has not yet been entered by any European. The inhabitants are foreigners, or the descendants of emigrants from the low lands. Lat. 29°. 35'. north, long. 79°. 40' east.

ALMORAVIDES, in history, a name given by the Spanish historians to an Arab tribe, which took possession of a district of Africa in order to live at their ease, and in a state of retirement; or, as they pretended, to follow the dictates of the Koran more closely than others of their sect, from whence they took the name of Morabites, which the Spaniards changed into that of Almoravides. The first prince or chief of this nation was Alubeker Ben Omar, who is commonly called by Spanish authors Abu Texfein, or Texfian, and who founded the dynasty of the Almoravides in Barbary, A. D. 1051.

ALMOST. *adv.* All and most. Most or greatest; part of the whole or all.

And in the sabot suyng *almost* al the citee cam togidre to heere the word of God.

Wiclif's Dedis. c. xiii.

Who is there *almost*: whose mind, at some time or other, love or anger, fear or grief, has not so fastened to some clog, that it could not turn itself to any other object.

There can be no such thing or notion, as an *almost* infinite; there can be nothing next or second, to an omnipotent God.

Bentley's Sermons.

Atlas becomes unequal to his freight;
And *almost* faints, beneath the glowing weight.

Addison.

ALMOXARIFARGO, in commerce, a duty of two and a half per cent. on bulls' hides in Spain.

ALMS, *n.* Said to be derived from **AL'M'ONER**, } $\{\delta\lambda\eta\mu\sigma\sigma\eta$, from $\delta\lambda\epsilon\sigma\eta$ **AL'M'ONY**, } mercy, by the following process, 'Almosine—almosic—almose—almes—alms.' *Tooke's Charitable Donation.*

Reufol he was to neody men, of hys *almesse* large
and fre.

R. Gloucester, p. 330.

And yet he geueth *almesse*,
And fastelh ofte and hearth messe,

Gower. Con. A. b. i.

And lo a man stood before me in a whyt clooth and
scide, Cornelie thi prier is herd, and thin *almes-*
deedes ben in mynde in the sight of God.

Wiclif. The Dedis of Apostol. c. x.

The second was an *almner* of the place,
His office was the hungry for to feed,
And thirsty give to drinke; a work of grace :
He fear'd not once himselfe to be in need.

Spenser's Faerie Queene, b. i. c. x.

He endowed many religious foundations, and yet
was he a great *alms-giver* in secret; which shewed,
that his works in publick were dedicated rather to
God's glory, than his own.

Bacon.

This woman was full of good works, and *alms-deeds*,
which she did.

Acts ix. 36.

Hard-favour'd Richard, where art thou?
Thou art not here: murder is thy *almsdeed*;

Petitioner for blood thou ne'er put'st back.

Shakspeare.

I'll give my jewels, for a set of beads;
My gorgous palace, for hermitage;

My gay apparel, for an *alms-man's* gown.

Id.

My arm'd knees,

Which how'd but in my stirrup, bend like his,
That hath received an *alms*.

Id.

The poor beggar hath a just demand of an *alms*
from the rich man, who is guilty of fraud, injustice,
and oppression, if he does not afford relief according
to his abilities.

Swift.

Many penitents, after the robbing of temples and
other rapine, build an hospital or *alms-house*, out of
the ruins of the church, and the spoils of widows and
orphans.

L'Estrange.

Such statter'd ears as are not worth your care,
Your charity for *alms* may safely spare,

For *alms* are but the vehicles of pray'r.

Hind and Panther. Dryden's Poems.

Behold yon *alms-house*, neat, but void of state;
Where age and want sit smiling at the gate.

Pope.

Power and authority are sometimes bought by
kindness; but they can never be begged as *alms*,
by an impoverished and defeated violence.

Burke.

ALMS in the early ages of Christianity, were divided into four parts; one of which was allotted to the bishop, another to the priests, and a third to the deacons and subdeacons, which made their whole subsistence; and the fourth part was employed in relieving the poor, and in repairing the churches. No religious system is more frequent or warm in its exhortations to alms-giving than the Mahomedan. The Alcoran represents alms as a necessary means to make prayer be heard. Hence that saying of one of their caliphs: 'Prayer carries us half way to God; fasting brings us to the door of his palace, and alms introduces us into the presence-chamber.' Many illustrious examples of this virtue are recorded among the Mahomedans. Hassan, the son of Ali, the grandson of Mahomet, in particular, is related to have thrice in his life divided his substance equally between himself and the poor, and twice to have given away all he had. And many of them extended their charity even to brutes.—Alms also signify lands or other effects left to churches or religious houses, on condition of praying for the soul of the donor. They were divided into alms free, which were liable to no

rent or service; reasonable alms, a certain portion of the estates of intestate persons, allotted to the poor; paschal alms at Easter, &c.

ALMS-BOX, or ALMS-CHEST, a small chest or coffer, called by the Greeks *Kibarion*, wherein anciently the alms were collected, both at church and at private houses. Thus also a strong box, with a hole in the upper part, having three keys, was formerly directed to be placed in every church in England, by the book of canons.

ALMUCANTARS, in astronomy, the same as parallels of altitude. See **ALMACANTAR.**

ALMUCIUM, in ecclesiastical affairs, a kind of cover for the head, worn chiefly by monks and ecclesiastics: it was of a square form, and seems to have given rise to the bonnets of the same shape still retained in the universities and cathedrals. Almucium was also used for the furs or muffs which were worn by the canons on their left arms.

ALMUDE, in commerce, a liquid measure in Portugal, &c. At Lisbon, wine and oil are sold by the pipe of twenty-six almudes; but the pipe of Lisbon wine sent to England contains about thirty-one almudes; and the standard gauge at the London custom-house is 140 gallons; the Lisbon almude is therefore reckoned at 4½ English gallons. At Oporto, the pipe is divided into twenty-one almudes; which almude and its sub-divisions are 49½ per cent. greater than those of Lisbon; so that the standard gauge of a pipe of port at the custom-house of London, is 138 gallons, and the almude of Oporto is accordingly equal to six English gallons and five pints nearly.

ALMUDEVAR, a town and district of Aragon, included in the district of Huesca.

ALMUGAVARI, in archaeology, a name for the Spanish soldiers who distinguished themselves against the Saracens.

ALMUGIA, in astrology, denotes a certain configuration of the five planets, in respect to the sun and moon, correspondent to that which is between the hours of those planets, and the sun's and moon's hours.

ALMUGIM. See **ALMIGGIM.**

ALMUGNECAR, a town of the province of Granada, Spain, with 2000 inhabitants, a good harbour, and a castle. It was long in the possession of the Moors, and is thirty-six miles south south-west of Granada.

ALMUNIA, in archaeology, a sort of tenure in use among the Spaniards.

ALMUTEN, in astrology, the lord of a figure, or strongest planet in a nativity.

ALMUTRIUM, in archaeology, a cap made with lambs or goats' skins. *Dugd. Mon. Engl.*

ALNA, a river in the county of Orkney.

ALNA FIRTH, a small vœ, or harbour, at the mouth of the Alna, in the parish of Delting, in Orkney.

ALNABATI, in the *materia medica*, a name given by Avicenna and Scapton to the siliqua dulcis, or carob-tree. They called both this and the acacia, by the common name charnub; but distinguish this as a gentle purge, whereas the other is astringent.

ALNAGAK, ALNAGER, or ALNEGER, n. s. from *alnage*, a measure by the ell, a sworn

officer, whose business it formerly was to inspect the assize of woollen cloth, and to fix the seals appointed upon it for that purpose.

ALNCESTER, a town in Cumberland, seated on the Alne, memorable for a synod of the Anglo-Saxons held in it.

ALNSEE, in mineralogy, a name sometimes given to tin.

ALNEMOUTH, a sea-port in Northumberland, seated on the mouth of the Alne, where some bones of a gigantic size have been dug up. The harbour is safe for fishing and other small vessels. Some of 300 tons burden are built here. In the reign of queen Elizabeth, the French took possession of this town and fortified it. Distant five miles from Alnwick, and 315 from London.

ALNERIC, in chemistry, sulphur vivum.

ALNEY, a small island in the Severn, near the city of Gloucester, famous for the royal duel fought upon it, in sight of both their armies, between king Edmund Ironside, and Canute king of Denmark; the latter being wounded, he proposed an amicable division, and accordingly obtained the north part of the kingdom, the south falling to Edmund.

ALNUS, in botany, the alder-tree, a species of betula. See **BETULA.**

ALNUS, in the ancient theatres, that part which was most distant from the stage.

ALNUS BACCIFERA, the berry-bearing alder, in botany, a name given by some writers to the frangula.

ALNWICK, the county town of Northumberland, on the road to Scotland; a place peculiarly fatal to some of the ancient Scots monarchs.—Here Malcolm III. making an inroad into Northumberland, was killed, with Edward his son, and his army defeated by Robert Mowbray, earl of this county, A.D. 1093. Malcolm having besieged this town, and obliged it to surrender, a soldier pretending to present the keys on a spear, stabbed him to the heart; and his son Edward, attempting to avenge his death, was also slain, and his army routed. Here too his great-grandson, William I., invading England with an army of 80,000 men, was encountered, his army routed, and himself made prisoner, A.D. 1174. Alnwick appears to have been formerly fortified, by the vestiges of a wall still visible in many parts, and three gates which are almost entire.—But its chief ornament is the stately Gothic castle of the duke of Northumberland, which stands on the south side of the town, and commands a beautiful view of the surrounding country. It was a strong fortress in the time of the Saxons, and has been lately repaired and improved with great taste and judgment. The market-place is a spacious square, and there is a large town-house, where the quarter-sessions and county courts are held. The duke of Northumberland has also built a stone bridge over the Alne. The government of the town is vested in four chamberlains, who are chosen once in two years, out of a common-council of twenty-four. The manner of making freemen is said to be as follows: The persons who are to be made free, or, as the phrase is, leap the well, assemble in the market-place, very early in the morning, on St. Mark's

day. They appear on horse-back, with every man his sword by his side, dressed in white, and with white night-caps, attended by the four chamberlains and the castle bailiff, mounted and armed in the same manner; hence they proceed, with music playing before them, to a large dirty pool, called Freeman's Well, where they dismount and draw up in a body, at some distance from the water; and then rush into it all at once, and scramble through it as fast as they can. As the water is generally foul, they come out in a dirty condition; but taking a dram, they put on dry clothes, remount their horses, and ride full gallop round the confines of the district; then re-enter the town sword in hand, and are met by the inhabitants dressed in ribbons with bells and garlands. These are called timber-wasts. The houses of the new freemen are on this day distinguished by a great holly bush, as a signal for their friends to assemble and make merry with them after their return. This ceremony is ascribed to an order of king John, who was mired in this neighbourhood. Market on Saturday.—Alnwick is seated on the Alne, 310 miles north by west from London, thirty-three north of Newcastle, and twenty-six south of Berwick. Inhabitants, 6000.

ALOA, in Grecian and Roman antiquity, a festival held in honour of Ceres, by the husbandmen, and supposed to resemble our harvest-home. Some derive the name of the town of Alloa, from this festival.

ALOADDIN, better known by the appellation of the old man of the mountains, was prince of the Arsacides, or assassins, from whence the word assassin is derived: his residence was a castle between Antioch and Damascus, and he had a number of young men with him who were so devoted to his will, as to engage in any undertaking he chose to send them upon. This made the neighbouring princes very careful not to offend him. He and his subjects were Mabommedans.

ALODIUM. See ALLODIUM.

ALOE, in botany, *αλοή*, the name of a plant. It is derived, in all probability, from the Hebrew *לְהָאֵת*. The aloe which comes from India is said to resemble the squill, with the exception, that it is bigger, and provided with fatter leaves. The juice, which is found sticking to the plant like a tear, is exceedingly bitter; but is greatly famed for its medicinal virtues. *Dioscor. 1. 3. c. 25. Ruff. Ephes. Fragment. de Med. Purg. Gal. Comm. 2. in Hippocrat. de Art. c. 49. Cels. de Re Med. 1. 2. c. 12. Oribas. Med. Coll. 1. 7. c. 27. Act. Tetrab. i. Serm. iii. c. 24. Actuar. de Meth. Med. 1. 5. c. 8. Salmas. Exercit. Plin. 1053. Plin. 1. 27.*

Aloe, in the Linnaean system, is a genus of the order monogynia, class hexandria; and, in the natural method, ranking under the tenth order, coronarie. The characters are: No CALYX: cor. monopetalous, erect, six-cleft, and oblong; tube gibbous; border spreading, and small; with a nectary-bearing bottom: STAM. six subulate filaments, rather surpassing the corolla in length, and inserted into the receptacle: the ANTHERÆ oblong and incumbent: the PIST. ovate germin; STYLE simple, the length of

the stamina; the STIG. obtuse and trifid: the PER. an oblong capsule, three-furrowed, three-celled, three-valved: seeds many and angular. The proper earth for planting these vegetables in, is, one half fresh light earth from a common, and the rest an equal mixture of white sea-sand and sifted lime-rubbish. This mixture should always be made six or eight months before the plants are to be set in it. The common aloe will live in a dry green-house in winter; and may be placed in the open air in summer in a sheltered situation, but must have very little water. Most of the other aloes are best preserved in an airy glass-case, in which there is a stove, to make a little fire in very bad weather. The tenderest kinds require a greater share of heat to preserve them in winter, and should be kept in a good stove, in air ten degrees above temperate. Many other kinds may also be kept in this heat; but the greater the heat, the more water they always require. About the beginning of June, it is usual in England to set the pots of aloes out of the house; but they should be set under the shelter of hedges or trees, to keep them from the violence of the sun; the rains also, which usually fall in this and the following month, are apt to rot them. It is therefore best to keep them under cover the greatest part of the year. The best time to shift these plants is the middle of July. They are, on this occasion, to be taken out of the pots, the loose earth to be picked from about their roots, and the decayed or mouldy parts of them cut off; then a few stones are to be put at the bottom of the pot, and it is to be filled with the composition before described, and the plants carefully put in, the roots being so disposed as not to interfere with one another. They are to be carefully watered after this, at times, for three weeks, and set in a shady place. The common kind will bear the open air from May to October, and should be shifted every year. All the aloes are propagated by off-ssets, or by planting the leaves. The off-ssets should be taken from the mother plant at the time when it is shifted: they are to be planted in very small pots of the proper mixed earth; and if that part of them which joined to the mother plant be observed to be moist when taken off, it should lie on the ground in a shady place two or three days before it is planted, otherwise it will rot. After planting these, they should remain in a shady place a fortnight; and then be removed to a very moderate hot bed, plunging the pots therein, which will help their striking new roots. Towards the end of August they must be, by degrees, hardened to the open air, by taking off the glasses of the hot-bed; and, in September, they may be removed into the green-house. Of this genus, some botanical writers enumerate only ten species; Miller and others mention twenty-five; while others, with Dr. Johnson, as above, state no fewer than thirty-nine species. But, in enumerating so many, those writers must have confounded the various species of different genera, such as those of the agave, aletris, &c. with this genus: of which we shall only particularise the following:—

1. Aloe Disticha, by some called the soap aloe, by others the caballine aloe, seldom rises

above two feet high. The leaves are very broad at the base, where they closely embrace the stalk, and gradually decrease to a point. The edges are set with sharp spines, and the under leaves spread open horizontally every way. These are of a dark green colour, spotted with white, somewhat resembling the colour of soft soap, from whence the plant got the name of soap-aloe. The flowers grow in umbels on the tops of the stalks, are of a beautiful red colour, and appear in August and September.

2. Aloe lingua-formæ, or tongue aloe, has its leaves about six inches in length, and shaped like a tongue. The flowers grow in slender loose spikes, each hanging downward, of a red colour below, and green at the top.

3. Aloe margaritifera, or pearl aloe, is a very beautiful plant. It is smaller than most of the aloe kind. The leaves are short, very thick, sharp pointed, and turning down, with a large thick end, appear there triangular. The colour of the leaves is a fine green striped in an elegant manner with white, and frequently tipped with red at the point. The flower-stalk, which rises in the midst of the leaves, is round, smooth, of a purple colour, and generally about eight inches high. When the plant has been properly cultivated, the flowers are striped with green and white; and sometimes they are entirely white. This aloe is singular in not having the bitter resinous juice with which the leaves of most others abound; when a leaf of this species is cut, what runs from it is watery, colourless, and perfectly insipid.

4. Aloe perfoliata, or Socotrine aloe, has long, narrow, succulent leaves, which come out without any order, and form large heads. The stalks grow three or four feet high; and have two, three, and sometimes four of these heads branching out from it. The flowers grow in long spikes, each standing on a pretty long foot-stalk; they are of a bright red colour, tipped with green, and generally appear in the winter season.

5. Aloe retusa, or cushion aloe, hath very short, thick, succulent leaves, compressed on the upper side like a cushion. This grows very close to the ground; the flowers grow on slender stalks, and are of an herbaceous colour.

6. Aloe spiralis, with oval crenated flowers, grows somewhat like the former; only the flowers grow upon taller stalks, which branch out and grow in very long close spikes.

7. Aloe variegata, or partridge breast aloe, is a low plant, seldom rising above eight inches high. The leaves are triangular, and curiously veined and spotted, somewhat like the feathers of a partridge's breast. The flowers grow in very loose spikes, and are of a fine red colour, tipped with green.

8. Aloe viscosa, with funnel-shaped flowers, grows near a foot high, with triangular leaves of a dark green colour. The flowers grow thinly upon very slender footstalks, are of an herbaceous colour, and their upper part turns backward. The species, of which aloe is the most commonly received name, are the crapula perfoliata, the agave Americana, the dacæna mar-

ginata, the aletris uvaria, and the yucca aloifolia, of Linnaeus.

ALOES. *n. s.* אַלְוֵס, as it is supposed. It is applied to three different things. 1. A precious wood used in the East, for perfumes, of which the best sort is of higher price than gold, and was the most valuable present given by the king of Siam, in 1686, to the king of France. It is called tambac, and is the heart, or innermost part of the aloe-tree; the next part to which is called calembac, which is sometimes imported into Europe; and, though of inferior value to the tambac, is much esteemed: the part next the bark is termed, by the Portuguese, pao d'aquila, or eagle-wood; but some account the eagle-wood not the outer part of the tambac, but another species. Our knowledge of the wood is yet very imperfect.—Savary. 2. Aloes is a tree which grows in hot countries, and even in the mountains of Spain. 3. Aloes is a medicinal juice, extracted not from the odiferous, but the common aloe-tree, by cutting the leaves and exposing the juice that drops from them to the sun. It is distinguished into Socotrine and caballine, or horse aloes: the first is so called from Socotra; the second, because, being coarser, it ought to be confined to the use of farriers. It is a warm and strong cathartic.

With respect to the manifold uses of aloes, we shall now make a few observations. The aloe is a kind of symbolic plant to the Mahomedans, especially in Egypt, and in some measure dedicated to the offices of religion; for whoever returns from a pilgrimage to Meeca, hangs it over his street door, as a token of his having performed that holy journey. The superstitious Egyptians believe that this plant hinders evil spirits and apparitions from entering the house; and, on this account, whoever walks the streets in Cairo, will find it over the doors both of Christians and Jews. From this plant the Egyptians distil a water, which is sold in the apothecaries' shops at Cairo, and recommended in coughs, hysterics, and asthmas. An unexperienced French surgeon, says Hasselquist, gave a Coptite, forty years old, afflicted with the jaundice, four tea-cups full of the distilled water of a species of aloe, and cured him in four days. This remedy, unknown to our apothecaries, is not difficult to be obtained, as the plants might easily be raised in the warm southern parts of Europe. The Arabians call it sabbara. Of the leaves of the Guinea aloe, mentioned by Mr Adanson in his voyage to Senegal, the negroes make very good ropes, not apt to rot in the water. Dr. Sloane mentions two sorts of aloes; one of which is used for fishing-lines, bowstrings, stockings, and hammocks; the other has leaves which, like those of the wild pine and banana, hold rain water; and, therefore, afford a very necessary refreshment to travellers in hot countries, where there is generally a scarcity of wells and water. The maguel, a species of aloe in Mexico, yields almost every thing necessary to the life of the poor in that country. Besides making excellent hedges for their fields, its trunk serves in place of beams for the roofs of their houses, and its leaves in

stead of tiles. From those leaves they obtain paper, thread, needles, clothing, shoes, stockings, and cordage; and, from its copious juice, they make wine, honey, sugar, and vinegar. Of the trunk, and thickest part of the leaves, when well baked, they make a very tolerable dish of food. Lastly, it is a powerful medicine in several disorders, and particularly in those of obstructions of the urine. It is also one of the plants the most valued and most profitable to the Spaniards.

As to the medical properties of Aloes, the substance, known by the name of aloes, is the inspissated juice of some of the above-mentioned species. The ancients distinguished two sorts of aloes: the one was pure, and of a yellowish colour, inclining to red, resembling the colour of a liver, and thence named hepatic; the other was full of impurities, and hence supposed to be only the dross of the better kind. At present, various sorts are met with, distinguished either from the place whence they are derived; from the species of the plants; or from some difference in the juices themselves. Of these, we shall notice the common aloes, or juice of the officinal aloe—hepatic aloes, the juice of the guinea aloe, so called from its liver-like colour—caballine, or horse aloes, from the same plant, but a coarser sort, commonly given to horses; Socotrine aloes, from the juice of the aloe of Socotra. Those commonly sold in the shops may be arranged in three classes, viz.

1. Aloes caballinae, folid, caballine, or horse-aloes, is supposed to be a coarse sort obtained from the aloe perfoliata; according to others, it is the produce of the aloe disticha. It is chiefly distinguishable by its strong rank smell.

2. Aloes hepatica, hepatic, Barbadoes, or common aloes, the juice of a variety of the former, is not so clear and bright as it; it is also of a darker colour, more compact texture, and for the most part drier. Its smell is much stronger and more disagreeable; the taste intensely bitter and nauseous, with little or nothing of the fine aromatic flavour of the Socotrine. The best hepatic aloes come from Barbadoes in large gourd shells; an inferior sort, which is generally soft and clammy, is brought over in casks. Of the cultivation and preparation of hepatic aloes in the island of Barbadoes, we have the following account in the London Medical Journal, vol. viii. art. 8.—‘The lands in the vicinity of the sea, that is, from two to three miles, which are rather subject to drought than otherwise, and are so stony and shallow as not to admit of the planting of sugar-canies with any prospect of success, are generally found to answer best for the aloe plant. The stones, at least the larger ones, are first picked up, and either packed in heaps upon the most shallow barren spots, or laid round the field as a dry wall. The land is then lightly ploughed, and very carefully cleared of all noxious weeds, lined at one foot distance from row to row, and the young plants set, like cabbages, at about five or six inches from each other. This regular mode of lining and setting the plants is practised only by the most exact planters, in order to facilitate the weeding of them, by hand, very frequently;

VOL. I.

because, if they are not kept perfectly clean and free from weeds, the produce will be but very small. They will bear being planted in any season of the year, even in the driest, as they will live on the surface of the earth for many weeks without a drop of rain. The most general time, however, of planting them, is from April to June. In the March following the labourers carry a parcel of tubs and jars into the field, and each takes a slip or breadth of it, and begins by laying hold of a bunch of the blades, as much as he can conveniently grasp with one hand, while with the other he cuts it just above the surface of the earth, as quickly as possible, that the juice may not be wasted; and then places the blades in the tub, bunch by bunch, or handful by handful. When the first tub is thus packed quite full, a second is begun (each labourer having two;) and, by the time the second is filled, all the juice is generally drained out of the blades in the first tub. The blades are then lightly taken out, and thrown over the land by way of manure; and the juice is poured out into a jar. The tub is then filled again with blades; and so, alternately, till the labourer has produced his jar full, or about four gallons and a half of juice, which is often done in six or seven hours; and he has then the remainder of the day to himself, it being his employer's interest to get each day's operation as quickly done as possible. It may be observed, that although aloes are often cut in nine, ten, or twelve months after being planted, they are not in perfection till the second and third year; and that they will be productive for a length of time, say ten or twelve years, or even for a much longer time, if good dung, or manure of any kind, is strewed over the field once in three or four years, or oftener if convenient.—The aloe juice will keep for several weeks without injury. It is therefore not boiled till a sufficient quantity is procured to make it an object for the boiling house. In the large way, three boilers, either of iron or of copper, are placed to one fire, though some have but two, and the small planters only one. The boilers are filled with the juice; and as it ripens or becomes more inspissated, by a constant but regular fire, it is ladled forward from boiler to boiler, and fresh juice is added to that farthest from the fire, till the juice in that nearest to the fire (by much the smallest of the three, and commonly called by the name of tatch, as in the manufactory of sugar) becomes of a proper consistency to be skipped or ladled out into gourds, or other small vessels used for its final reception. The proper time to skip or ladle it out of the tatch, is when it is arrived at what is termed a resin height, or when it cuts freely, or in thin flakes, from the edges of a small wooden slice, that is dipped from time to time into the tatch for that purpose. A little lime water is used by some aloe boilers, during the process, when the ebullition is too great.—As to the sun-dried aloes, which is most used for medicinal purposes, very little is made in Barbadoes. The process is, however, very simple, though extremely tedious. The raw juice is either put into bladders, left quite open at top, and suspended in the

sun, or in broad shallow trays of wood, pewter or tin, exposed also to the sun, every dry day, until all the fluid parts are exhaled, and a perfect resin formed, which is then packed up for use, or for exportation.'—The Barbadoes aloes is said to be common also in the other West India islands; and the following account of the manner of preparing it in Jamaica is given by Dr. Wright in the same volume of the Medical Journal, art. 1. 'The plant is pulled up by the roots, and carefully cleansed from the earth or other impurities. It is then sliced and cut in pieces into small hand-baskets or nets. These nets or baskets are put into large iron boilers with water, and boiled for ten minutes; when they are taken out, and fresh parcels supplied till the liquor is strong and black. At this period the liquor is thrown through a strainer into a deep vat, narrow at bottom, to cool, and to deposite its feculent parts. Next day the clear liquor is drawn off by a cock, and again committed to the large vessel. At first it is boiled briskly; but towards the end of the evaporation, is slow, and requires constantly stirring to prevent burning. When it becomes of the consistence of honey, it is poured into gourds or calabashes for sale. This hardens by age.'

3. Aloes perfoliatæ, Socotrinae aloes, brought from the island of Socotra in the Indian ocean, wrapt in skins; it is obtained from the fourth species above-mentioned. This sort is the purest of the three; it is of a glossy surface, clear, and in some degree pellucid; in the lump, of a yellowish red colour, with a purple cast; when reduced to powder, of a bright golden colour. It is hard and friable in the winter, somewhat pliable in summer, and grows soft betwixt the fingers. Its taste is bitter, accompanied with an aromatic flavour, but insufficient to prevent its being disagreeable: the smell is not very unpleasant, and somewhat resembles that of myrrh. With regard to the physical effects of aloes, all the different kinds are gum resins, which contain more gummy than resinous parts. Water, when of a boiling heat, dissolves all the soluble parts of aloes; but if let stand till it grows cold, they drop most of their resin. A strong spirit dissolves and keeps suspended almost the whole of the aloes, though they contain such a large portion of gummy parts; hence it is evident, that aloes contain some principle, saline or other, which renders water capable of dissolving resin, and spirit capable of dissolving gum. Aloes are a stimulating stomachic purge, which, given in small quantity, operates mildly by stool; but in large doses acts roughly, and often occasions an irritation about the anus, and sometimes a discharge of blood. They are good opening medicines to people of lax habit, or who live a sedentary life; and to those whose stomach and bowels are loaded with phlegm or mucus, or who are troubled with worms, or are debilitated; because, at the same time that they carry off those viscid humours, which pall the appetite, and overload the intestines, they serve as strengtheners. In small doses, repeated from time to time, they not only cleanse the *principæ via*, but likewise tend to promote the menstrual discharge in women; and

therefore are frequently employed in chlorosis, or where the menstrua are obstructed. They are a good stomachic purge, and given in all cases where such a one is wanted; but are considered as a heating medicine, and not proper in bilious habits, or where there is much heat or fever; and a continued use is apt to bring on the piles. Aloes are given in substance from five grains to a scruple, though formerly it used to be prescribed in doses of two or three times that quantity; but these large doses sometimes brought on troublesome symptoms. As they operate slowly, they are generally taken at bed time, and operate next day. With regard to aloes, as well as all other resinous purges, it ought to be observed, that when they are given in substance without any mixture, they are apt to adhere to the coats of the intestines, and to occasion griping and uneasiness; for these reasons aloes are generally mixed with some saponaceous or resinous body to destroy their viscid tenacity: they are given in substance. The substances which are most used for this purpose are, a small quantity of the fixed alkaline salts, soap, the yolk of an egg, and gummy vegetable extracts. Mr Barton alleges, that by triturating aloes with a small quantity of alkaline salts, their tenacity was more effectually destroyed than by any other thing he tried: that Castile soap and the yolk of an egg answered next best; that manna, sugar, and honey, were far inferior to them; and that gummy, or mucous vegetable extracts, such as the extracts of gentian, or of liquorice root, triturated with the aloes, in the proportion of one part of the extract to two of the aloes, and then made up into pills with a sufficient quantity of syrup, destroyed the viscosity of the aloes, and rendered their operation mild. Socotrinae aloes contain more gummy matter than hepatic and hence are likewise found to purge more, and with greater irritation. The first sort therefore is most proper where a stimulus is required, as for pronouncing or exciting the menstrual flux; whilst the latter is better calculated to act as a common purge. For preparations of aloes, see PHARMACY, *Index*.

With regard to aloes wood, many authors mistake the plant and tree for each other; because, we have but little knowledge of the tree; and the drug which the plant produces is much better known, and of much greater use. The aloe tree grows in China, in the kingdom of Lao, in Cochin China, Champae, and Sumatra. It is about the same height and form as the olive tree; its trunk is of three colours, and contains three sorts of wood: the heart is dearer in the Indies than even gold itself; it serves to perfume clothes and apartments, and is reckoned a sovereign cordial in fainting fits, and against the palsy. It destroys the tinea and ascarides in children. It is used at sacrifices, as incense, by the Chinese, and all the heathen Moors. It is also used to set the most precious jewels that are worked in the Indies. The aloes wood is very highly valued; and divers strange fables have been invented to the origin of the tree that yields it; some feign that it grew in paradise, and was only conveyed to us by means of the rivers overflowing

their banks, and sweeping off the trees in their way!!! Others suppose it to grow on inaccessible mountains, where it is guarded by certain wild beasts, &c. See XYLOE ALOES.

We shall only add that Braconnot was the first person who imagined he detected in aloes a peculiar principle, similar to the bitter resinous which Vauquelin has found in many febrifuge barks. The recent juice of the leaves absorbs oxygen, and becomes a fine reddish purple pigment.

ALOE, THE BASTARD. See ALETIRIS.

ALOE, THE GREAT AMERICAN. See AGAVE.

ALOE, XYLOE. See XYLOE.

ALOEDARY, aloedarium, *ἀλοηδαριον*, a purging medicine, wherein aloes is an ingredient; or an aloetic. It is also used for a history of the class of plants, under the denomination of aloes.

ALOEUS, in entomology, a species of scarabaei, or beetle. Characters: thorax three-horned, intermediate longer and simple; head submitticous; elytrae unstriated; found in America.

ALOEUS, in ancient mythology, a giant, the son of Titan and Terra, who married Iphimedina, by whom Neptune had the twins Othus and Ephialtus. Aloeus educated them as his own, whence they were called Aloides. They grew nine inches every month, and when nine years old, made war against the gods, but were slain by Apollo and Diana. They also built Asca, a town at the foot of Mount Helicon.

ALOENYXIUM, *ἀλογνύλον*, in botany, aloes-wood, a name given to the tree producing this precious wood, by Loureiro; who refers it to the class and order decandria monogynia, and its natural order seems to be lomentaceæ, Linnaeus; leguminosa, Jussieu. Its General Characters are: The CAL. perianthium inferior, of four acute, hairy, deciduous leaves; the lowermost falcate, incurved, nearly twice as long as the rest: COR. petals five, unequal, longer than the calyx: STAM. filaments ten: PIST. germ. superior, elongated, curved, compressed: STYLE thread-shaped: PERIC. legume woody, smooth, falcate: SEED solitary, oblong, curved, tunicated. Essential Characters: CAL. four acute deciduous leaves; the lower one longest: PETALS five, unequal: LEGUME curved: SEED solitary, tunicated. 1. A. Agallochum. Fragrant aloes-wood.—Native of the loftiest mountains of Cochin China, near the great river which runs between that kingdom and Laosios, and is a large lofty tree, with erect branches. Bark fibrous, brown, smooth, thin. Leaves alternate, stalked, lanceolate, flat, entire, smooth, coriaceous, about eight inches long. Flower-stalks terminal, many-flowered.

ALOFT'. adv. & prep. On loft; A. S. LÝFT, air: Lyft, luft, loft, above.

pe weder was fulle soft, pe wynde held pañ stillie,
pe saile was hie o loft, pei had no wynde at wille.

R. Branne, p. 169.

The great luminary

(*Aloft* the vulgar constellations' thick,
That from his lordly eye keep distance due)
Dispenses light from far. Milton's Par. Lost.

The fiend look'd up and knew
His mounted scale *aloft*: nor more, but

Murm'ring and with him fled the shades of night.

Paradise Lost, b. iv.

For I have read in stories oft,

That love has wings, and soars *aloft*. Suckling.

Upright he stood; and bore *aloft* his shield,

Conspicuous from afar; and overlook'd the field.

Dryden.

All crimes shall cease, and ancient frauds shall fail,
Returning Justice lift *aloft* her scale,

Peace o'er the world, her olive wand extend,

And white rob'd innocence from heaven descend.

Pope's Messiah.

All hands unmoor! proclaims a boist'rous cry,

All hands unmoor! the cavern'd rocks reply.

Rous'd from repose, *aloft* the sailors swarm,

And with their levers soon the windlass arm.

Falconer's Shipwreck.

ALOGIANS, in church history, from *a*, primitive, and *λογος*, the word, a sect of ancient heretics, who denied that Jesus Christ was the Logos, and rejected the gospel of St. John.—Some ascribe the origin of the name, as well as of the sect of Alogians, to Theodore of Byzantium, by trade a currier. They rose toward the close of the second century.

ALOGOTROPHIA, in medicine, a term signifying the unequal growth or nourishment of any part of the body, as in the rickets.

ALOIDES, in botany, a name given by some to the aloe *paustris*, or fresh water aloe; often called in England, water soldier, and by Linnaeus, *stratiotes*.

ALONE', adv. & adj. } All one : one being

ALON'LY, adv. & adj. } all; unaccompanied.

ALON'NESS.

He sond no man pat durst, for non had myght,
With Colibrant alone in batiale to fight.

R. Branne, p. 31.

Let us alone, to guard Corioles:

If they set down before's; 'fore they remove,
Bring up your army. Shakesp.

Let you alone, cunning artificer;

See, how his gorget peers above his gown,
To tell the people in what danger he was. Ben Jon.

Eagles we see fly *alone*; and they are but sheep,
which always herd together. Sidney.

Alone, for other creature in this place,

Living or lifeless, to be found was none. Milton.

I never durst in darkness be *alone*. Dryden

But midst the crowd, the hum, the shock of men,

To hear, to see, to feel, and to possess,

And roam along, the world's tired denizen,

With none who bless us, none whom we can bless :

Minions of splendour shrinking from distress!

None that with kindred consciousness endued,

If we were not, would seem to smile the less

Of all that flatter'd, follow'd, sought, and sued ;

This is to be *alone*; this, this is solitude!

Lord Byron's Childe Harold.

ALONG, v. & prep. } On long. See LONG.

ALONG'ST. } Along, the past participle, means, produced from the A. S. Gelang, (Tooke) to long, to make long.

Here I sallie *be gyne alle myn heritage*,

& als *along* as I lyue to he in þin ostage.

R. Branne, p. 196.

I your commission will forthwith dispatch;

And he to England shall *along* with you.

Shakesp. Hamlet.

Hence then! and Evil go with thee *along*!

Tby offspring, to the place of evil, hell. Milton.

Religious zeal is subject to an excess, and to a defect; when something is mingled with it, which it

should not have ; or, when it wants something, that ought to go *along with it.*

Sprat.

Command thy slaves : my free-born soul disdains
A tyrant's curb, and restive breaks the reins.
Take this *along* ; and no dispute shall rise
(Though mine the woman) for my ravish'd prize.

Dryden.

A needless Alexandrine ends the song :
That like a wounded snake drags its slow length *along.*

Pope's Essay on Criticism, 356.

Slow sinks, more lovely ere his race be run,
Along Morea's hills the setting sun ;
Not as in northern climes obscurely bright,
But one unclouded blaze of living light !

Lord Byron's Corsair.

ALONG-LIVING, in maritime affairs, a term applied to a vessel when pressed down sideways, by the action of a side wind against the sails.

ALONG-SHORE, is applied to coasting navigation, or to a course which is in sight of, or nearly parallel to, the shore.

ALONG-SIDE, side by side, or parallel to a wharf, ship, or any other object.

ALOO, STRAITS OF, a channel in the Eastern seas, between the islands of Lomablem and Pantar.

ALOOF, *adv.* All off, entirely separate ; at a distance. Perhaps of the same origin with aloft.

Then bade the knight this lady yed *aloof,*
And to an hill herself withdraw aside ;
From whence she might behold the battle's proof,
And else be safe from danger far descried.

Fuerie Queen.

As next in worth,
Came singly where he stood, on the bare strand ;
While the promiscuous crowd stood yet *aloof.*

Milton's Paradise Lost.

The noise approaches ; though our palace stood
Aloof from streets, encompass'd with a wood.

Dryden.

Under the law we might look at Christ *aloof*; now,
under the gospel, we may come near him.

Hall's Contemplations.

No domestic difficulties, no domestic weakness reached him ; but *aloof* from the sordid occurrences of life, and unsullied by its intercourse, he came occasionally into our system, to counsel and to decide.

Grattan's Character of Lord Chatham.

ALOOF, has been supposed to be a sea term ; and its similarity with the phrases keep a luff, or keep the luff, probably gave rise to this conjecture. If a sea phrase originally, it seems to have referred to the danger of a lee shore, in which situation the pilot might naturally apply it in the sense of keep all off ; it is, however, never expressed in that manner by seamen now. See LUFF.

ALOPE, in entomology, a species of the sphinx, with wings dentated and brown, the posterior yellow and black at the apex, the abdomen black, and having interrupted pale-coloured bands, found in India.

ALOPE, in ancient history, a daughter of Cercyon, king of Eleusis, who having a child by Neptune, exposed it in the woods, covered with a piece of her garment. The child being found, and brought to Cercyon, he recognised the garment, and ordered his daughter to be put to death. She was changed by Neptune into a fountain. Her son, named Hippothoon, was

afterwards placed by Theseus on the throne of his grandfather.

ALOPECIA, or ALOPECE, in ancient geography, two islands : viz. 1. An island of the Bosporus Cimmerius ; and 2. In the Ægean sea, over against Smyrna.

ALOPECIA, in medicine, a total falling off of the hair from certain parts, occasioned either by the defect of nutritious juice, or by a viscous corrosion of the roots of it. The word is formed from *ἀλωπηξ*, vulpes, a fox ; because it is a disease which is common to that creature. The alopecia properly differs from defluvium capilorum, as in the former certain parts are left entirely bald, whereas in the latter the hair only grows immoderately thin. It also differs from the ophiosis, as this latter creeps in spires about the head, like windings of a serpent, whereas the former is not confined to any figure. The remedies which remove the proximate cause of this malady are called *μετασυγκρίτικα*, metasyncritica. A multitude are to be found in the works of Taranta, Rondeletius, Hollerius, Celsus, and other physicians. Alopecia is also used by Galen, for a change of the hair to another colour. See PLICA POLONICA.

ALOPECIAS, in ichthyology, a name of the *vulpes marina*, or sea fox.

ALOPECURUS, or FOX-TAIL GRASS, in botany, a genus of the triandria digninia class ; and in the natural method ranking under the 4th order, graminea. The characters are : CAL. a single flowered bivalve glume : COR. one valved : STAM. three capillary filaments; the antheræ bifurcated at both ends : PIST. a roundish germen ; there are two styli ; and the stigmata are villous. The pericarpium is a corolla clothing the seed ; and the seed is ovate and covered. There are 8 species : viz. 1. A. *appetis*, a native of France. 2. A. *bulbosus*, or bulbous fox-tail grass. 3. A. *genikulatus*, or flore fox-tail grass ; these two species grow wild in Britain. 4. A. *hordeiformis*, a native of India. 5. A. *Monspeliensis*, a native of France, and the southern parts of Europe. 6. A. *Indicus*, or Indian fox-tail grass, a native of the East Indies. 7. A. *Paniculus*, a native of France, and the south of Europe. 8. A. *pratensis*, grows wild in Britain. See GRASS.

ALOPEX, in zoology, a species of the canis, with a strait tail and black tip. It is commonly called the field-fox.

ALOPEX, in entomology, a species of the scarabæus melolontha, hair yellow ; clypeus reflex and emarginated ; elytra smooth and black : found at the Cape of Good Hope. Gmelin refers to this genus the following species, beside those above enumerated, viz. A. *ciliatus*, with a culm spiked and erect, and ciliated glumes. A. *Carolinianus*, with radicating culm, subspiked panicle, smooth glumes, and awned corolla. A. *typhoides*, with simple raceme, and awnless flosculi. A. *caudatus*, with spiked caudated panicle, and flosculi intrenched with awns. A. *ovatus*, with panicle ovated, contracted, resembling a spike, and exterior petal awned before the apex. A. *Capensis*, with cylindric spike, and smooth awnless glumes, a native of the Cape of Good Hope. A. *Antarcticus*, with erect

culm, ovated spike, hairy glumes, and awned corollæ, the awns being longer than the calyx; native of the Straits of Magellan. *A. echinatus*, with spiked ovated panicle, punctuated, ciliated glumes, and geniculated culm; native of the Cape of Good Hope.

ALOSA, in ichthyology, the shad, a species of the clupea. See *CLUPEA*.

ALOSAT, in chemistry, *argentum virum*.

ALOSE', v. { Latin, *laus*, praise. To praise,

ALOSED', } or commend. Loos was formerly common.

Nofer lacky ne *alose*, ne leyve bat þer were

Eny wickeder in þis worlde, þan y were myself.

Vision of Pier's Ploughman, p. 326.

ALOSE, in ichthyology, a species of fish, which some take for the shad, (see *ALOSA*,) but it more in fact resembles the sardine, or pil-dine, or pilchard, though it is much larger. It is seldom seen in the British seas, and only visits the rivers in spring. The roes are valued in the East Indies, and form a lucrative article of trade.

ALOSING. In loosing.

And as they were a *losyng* ye colte, the owners thereof sayde vnto them, why loose ye the colte?

Bible, 1539, *S. Luke*, chap. xix.

ALOST, or **AEST**, a district of the Netherlands, which was the scene of some manœuvres during the French revolutionary war; also a town in the above-mentioned district, seated on the Dender, fifteen miles north-west of Brussels, and thirteen south-east from Ghent. It has but one parish; the church is collegiate, and has a provost, a dean, and twelve canons. It has two convents of Carmelites, one of capuchins, three nunneries, an hospital, and a convent of Guillemins, in which is the tomb of Theodore Martin, who first introduced the art of printing into the low countries. It was taken from the French in 1706, after the battle of Ramillies. Near this place Lord Moira effected a junction of the troops under his command, with those of General Clairfayt, in July 1793.

ALOUATE, in zoology, Buffon's name for the simia seniculus, or long-tailed, bearded, red monkey, of the Linnaean system, having a pre-hensile tail; the arabata of Gumilla, Oronoko, and royal monkey of Pennant. This species is sometimes found in Brazil, and is common in Cayenne. Its voice and manners are the same with those of the Simia Beelzebul. They are commonly seen in the woody islets of large flooded savannahs. Their cry or scream inspires terror, and seems as if the forests contained the united howlings of all its savage inhabitants together. This clamour, usually made in the morning and evening, is repeated in the course of the day, and sometimes in the night. In a state of captivity the animal loses its voice, and seldom lives long. The male is larger than the female, and the latter always carries her young on her back. In order to kill these animals, it is necessary to fire several times; while any life remains, and after they are dead, they will remain clinging to the branches by the hands and tail. Their flesh, after all the trouble of possessing them, is not good; it is always tough, and never admitted to any tables but to those of in-

digent inhabitants and travellers, to supply the want of other food.' This animal when full-grown is said to be as large as a calf, and to live on the fruit of the banana-tree.

ALLOUD', *adv.* On loud. Past part. of the verb to low, or to bellow (i. e. be-low); low'd, loud.

And he wepte *alowde*, so that the Egypcians, and the house of Pharao herde it.

Bible, 1539. *Genesis*, c. xiv.

Strangled he lies! yet seems to cry *aloud*,
To warn the mighty, and instruct the proud ;
That of the great, neglecting to be just,
Heav'n in a moment makes an heap of dust. *Waller*.

Then heav'n's high monarch thund'red thrice *aloud*,
And thrice he shook aloft a golden cloud. *Dryden*.

ALOW', *v. & adv.* See **ALLOW**. Signifying to be humbled.

Narcissus may example bee
and myrrour to the prowe,
By whome they may most plainly see
how pride hath been *allowde*. *Turberville*.

The queene [widow of Edward 4th] her self satto
alone *alowne* on the risches all desolate and dismayde,
whome the archebishoppe comforted in the best man-
ner hee coulde. *Sir Thos. Moore's Works*, f. 43. c. 1.

AY; or **AL**

ALP, in zoology, an English name used for the bull-finch.

ALPAGE, alpagium, in ancient writers, denotes the right of feeding cattle on the Alps or other high mountains, or a sum paid for the purchase of such a right.

ALPAGNA, or **CAMELUS PACO** of Linnaeus, in zoology, an animal of South America, much like the vigognas, except that the legs are shorter, and its muzzle thicker and flatter, so that it almost resembles a human face. The Peruvians use these animals as beasts of burden, and some of them carry a hundred weight. Of their wool they make stiffs, ropes, and bags, and of their bones tools for weavers.

ALPAM, in botany, the *siliquosa indica*, a native of the Indies. The stem of this plant, which divides itself twice or thrice, is covered with a bark of an ashy-green colour, inodorous, and of an acid astringent taste. It bears flowers and fruit as well at the end of the year as at the beginning, and is always full of leaves. Any part of this shrub made into an ointment with oil, is a remedy for the scab, and old ulcers. The juice of the leaves, with *calamus aromaticus*, is good against the venom of serpents.

ALP ARSLAN, the second sultan of the dynasty of Seljuk in Persia, was the son of David, and great grandson of Seljuk, the founder of the dynasty. He was born A. D. 1030, of the Hegira, 412. In place of Israel, which was his original name, he assumed that of Mohammed, when he embraced the Mussulman faith, and was afterwards surnamed Alp Arslan, which, in the Turkish language, signifies a valiant lion, on account of his military prowess. Having held the chief command of Khorasan for ten years, as lieutenant of his uncle, Togrel Beg, he succeeded him in 1063, and at the commencement of his reign saw himself sole monarch of all the countries from the river Oxus to the Tigris. In 1068 he invaded the Roman empire, the seat of which

was then at Constantinople; and, at the head of 40,000 cavalry, according to the highest accounts, he defeated Romanus Diogenes, commanding an army of 100,000 men, in the Armenian territory, and took him prisoner; but treated him kindly till he was ransomed, when he was dismissed loaded with presents. After a reign of ten years, in which he was not more distinguished for his valour, than for his liberality, piety, patience, justice, and sincerity, he was stabbed by a desperate Carizman, whom he had taken prisoner, in 1072. His words to his attendants, when he found his end approaching, are worthy record: ‘In my youth,’ said he, ‘I was advised by a wise man to humble myself before God; never to confide in my own strength, or despise the most contemptible enemy. These lessons I have neglected, for which I have now met deserved punishment. Yesterday, when I beheld from an eminence the number and discipline of my troops, I said in the confidence of my heart, ‘What power on earth can oppose me? What man dares to attack me? To day, vainly trusting to my own strength and dexterity, I foolishly checked the prompt zeal and alacrity of my guards for my safety, and now I have fallen by the hand of an assassin! but I perceive that no force or address can resist fate.’ Alp Arslan had a fine appearance, and covered his head with a high turban, folded in the form of a crown. The caliph Bemrillah conferred on him the title of Ezzedin, or Adadheddin, signifying ‘Defender of the Faith.’ It is said 1200 princes, or sons of princes, have stood at the foot of his throne.

ALPEN, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne; eight miles south-west of Wesel, and fifty north north-west of Cologne.

ALPHA, the name of the first letter in the Greek alphabet; corresponding to our A. It is formed from the Hebrew **א** (aleph); and according to Plutarch, was placed at the head of all the letters, because, in the Phœnician language, it denotes an ox; which was thought the most important among beasts. In composition this letter sometimes denotes privation, in the same sense with *αρεψ*, without; sometimes augmentation, as *αγαν*, much; and sometimes union, as *απα*, together. It is also used as a letter of order, to denote the first; and of number, to signify one; but when it was a numerical letter, a little stroke, or an acute accent, was drawn above it thus, A, to distinguish it from the mere A, which was a letter of order. See A.

ALPHA and OMEGA, in Scripture, signify the beginning and the end, or the first and the last, (i. e. before and after all things; and are therefore used as a hieroglyphic of the Divine Being.) They were also formerly the symbol of Christianity, and engraved accordingly on the tombs of the ancient Christians, to distinguish them from those of idolaters. They are still seen on some altar-pieces. ‘The Alpha and Omega’ is a title of Jesus Christ in the Apocalypse, derived from a mode of expression frequent amongst the Jewish rabbin. Some have supposed the verb *αει* to breathe, is designedly formed from the first and last letters of the Greek alphabet, to denote the first and last act of life.

ALPHA, in ancient geography, a river in the vicinity of Aquileia, near which Constantine was killed, and into which his body was thrown.

ALPHABET, n. { *Αλφα* alpha, *Βετα* beta.
ALPHABETICAL, } The literal characters of
ALPHABETICALLY, } any language collectively.
ALPHABETARIAN.

Thou shalt not sigh,
Nor winke, nor nod, nor kneele, nor make a signe;
But I of these will wrest an *alphabet*,
And by still practice learne to know thy meaning.

Shakspeare.

The letters of the *alphabet*, formed by the several motions of the mouth; and the great variety of syllables, composed of letters, and formed with almost equal velocity; and the endless number of words, capable of being framed out of the *alphabet*, either of more syllables or of one, are wonderful. *Holder.*

Taught by their nurses, little children get
This saying, sooner than their *alphabet*.

Dryd. jun. Jun.

I have digested, in an *alphabetical* order, all the counties, corporations, and boroughs in Great-Britain, with their respective tempers.

Swift.

I had once in my thoughts, to contrive a grammar, more than I can now comprise in short hints; and a dictionary, *alphabetically* containing the words of the language, which the deaf person is to learn.

Hoder's Elements of Speech.

ALPHABET, in grammar, of *αλφα* and *βετα*, Greek; *alphabetum*, Latin: the whole order or collection of letters which are used in any language. An extensive controversy has existed amongst learned men, whether the method of expressing our ideas by visible symbols, called letters, be really a human invention; or whether we ought to attribute an art so exceedingly useful, to an immediate inflation from the Deity. In favour of the latter opinion it has been urged, 1. That the five books of Moses are universally acknowledged to be the most ancient compositions, as well as the most early specimens of alphabetical writing extant. If, therefore, we suppose writing to be the result of human ingenuity, it must be different from all other arts, having been brought to perfection at once; as the Hebrew alphabet contains every thing essential to the exposition of human thoughts. It may indeed be replied, that alphabetical characters perhaps existed ages before the writings of Moses, though the more ancient specimens have perished. But the simplicity of manners predominant in the early ages, and the little intercourse which nations had with one another, will scarce allow us to suppose that such a complex and curious contrivance as alphabetical writing could be invented by a race of men whose wants were so few, their advantages so circumscribed, and their ideas so limited. 2. If alphabetical characters were a human invention, it might be expected that different nations would have fallen upon the same expedient independent of each other during the compass of so many ages. But no such thing has taken place; and the writing of every people on earth may be referred to one common original. If this can be proved, the argument from successive derivation, without a single instance of independent discovery, must be allowed to amount to the very highest degree.

ALPHABETICAL, adj. Pertaining to the alphabet; as, an *alphabetical* arrangement of a library. — *Alphabetical* is derived from the Greek *αλφα* and *βετα*, the first two letters of the Greek alphabet, and denotes the order of the letters in the alphabet, or the order of the words in a dictionary.

of probability in favour of our hypothesis, which will now rest on the evidence for or against this fact; and which may be summed up in the following manner:—Among the European nations we find none who can pretend any right to the discovery of letters. All of them derived the art from the Romans, excepting only the Turks, who had it from the Arabians. The Romans never laid claim to the discovery; but confessed that they derived their knowledge from the Greeks, and the latter owned that they had it from the Phoenicians; who, as well as their colonists the Carthaginians, spoke a dialect of the Hebrew scarcely varying from the original. The Coptic or Egyptian resembles the Greek in most of its characters, and is therefore to be referred to the same original. The Chaldee, Syriac, and latter Samaritan, are dialects of the Hebrew, without any considerable deviation, or many additional words. The Ethiopic differs more from the Hebrew, but less than the Arabic; yet that these languages have issued all from the same stock, the similarity of their formation, and the numberless words common to them, all sufficiently evince; and the Persic is very nearly allied to the Arabic. Alterations indeed would naturally be produced, in proportion to the civilization of the several nations, and their intercourse with others; which will account for the superior copiousness of some above the rest. It appears then, that all the languages in use amongst men, that have been conveyed in alphabetical characters, have been the languages of people connected ultimately or immediately with the Hebrews, who have handed down the earliest specimens of writing to posterity; and we have therefore the greatest reason to believe, that their method of writing, as well as their language, was derived from the same source. This proposition will be further confirmed from considering the sameness of the artificial denominations of the letters in the Oriental, Greek, and Latin languages, accompanied also by a similar arrangement, as alpha, beta, &c. Herodotus informs us, that ‘those Phoenicians who came with Cadmus, introduced many improvements among the Greeks, and alphabetical writing too, not known among them before that period. At first they used the Phoenician character; but in process of time, as the pronunciation altered, the standard of the letters was also changed. The Ionian Greeks inhabited at that time the parts adjacent to Phoenicia; who having received the art of alphabetical writing from the Phoenicians, used it, with an alteration of some few characters, and confessed ingenuously, that it was called Phoenician from the introducers of it.’ He tells us that he had himself seen the characters of Cadmus in a temple of Ismenius Apollo at Thelæs in Bœotia, engraven upon tripods, and very much resembling the Ionian characters. Again, the old Samaritan is precisely the same as the Hebrew language; and the Samaritan Pentateuch does not vary by a single letter in twenty words from the Hebrew: but the characters are widely different; for the Jews adopted the Chaldaic letters during their captivity at Babylon, instead of the characters of their forefathers. 3. What we know of those nations who have continued for many centuries

unconnected with the rest of the world, strongly militates against the hypothesis of the human invention of alphabetical writing. The experiment has been fairly made upon the ingenuity of mankind for a longer period than that which is supposed to have produced alphabetical writing by regular gradations; and this experiment determines perceptibly in their favour. The Chinese, a people famous for their discoveries and mechanical turn of genius, have made some advances towards the delineation of their ideas by arbitrary signs, but have nevertheless been unable to accomplish this exquisite device; and after so long a trial to no purpose, we may reasonably infer that their mode of writing, which is growing more intricate and voluminous every day, would never terminate in so clear, so comparatively simple an expedient as that of alphabetical characters. The Mexicans, too, had made some rude attempts of the same kind; but with less success than the Chinese. Hieroglyphics were also in use among the Egyptians posterior to the practice of alphabetical writing by the Jews; but whether the epistolography, as it is called, of the former people, which was in vogue during the continuance of the hieroglyphics, might not be another name for alphabetical writing, cannot be decided.

We shall not pursue this argument further, but offer the reader a table of the most celebrated alphabets of ancient and modern times referring to GRAMMAR, LANGUAGE, and the articles which treat of the respective countries, where they are or have been spoken, for further information respecting them.

ABYSSINIAN Alphabet. In substance the same as the ETHIOPIAN, which see.

ADAM, Alphabet of, a Chaldean alphabet attributed to Adam.

AOLIAN, an ancient Greek alphabet, according to Thesnius Ambrosius.

ANGLO-NORMAN, a variety of the GOTHIC alphabet, which see.

The ARABIC Alphabet is in its most ancient form called the Kufic from the city Kufa, on the Euphrates. It consists of initial letters used at the beginning; medial letters, or those used in the middle; and final letters, or those used at the end of words. The modern Arabic is said to have been invented by the vizier Molach, A.D. 933, who wrote the Koran three times in it, so fair and correct as to make it a perfect model of writing. This consists also of four sorts of characters, namely, single, initial, medial, and final, which is the common character of the Arabians, Turks, and Persians; but the two latter nations have added four more letters, namely,  p,  ch,  zh,  g, and given a different power to others. There are two other variations of the Arabic, namely, the African and Mauritanian, which are said to be used in different parts of Africa.

ARCADIAN, a Latin alphabet, taken from the Eugubian tables, and so called because supposed to have been brought by Evander from Arcadia into Latium.

ARMENIAN approaches, in many respects, very near to the Chaldee or Syriac, and to the

Greek in others. There is a common printing character of the Armenian capitals and small letter; and an ornamental kind of character, which is termed blooming, or flowery, because it is used for the titles of books: Duret likewise mentions an ancient Armenian character, which he says was taken from an inscription over an entrance into the castle of Curcho. *Schroeder. Thesaur. Ling. Armen.; Duret. Tresor. des Lang.* p. 725. It is used in Asia Minor, Syria, and Tartary, as well as Armenia.

ATTIC, a variation of the ancient Greek, which see.

BALI, a dialect used in Bali, an island north of Java.

BARMAN, an alphabet of the kingdom of Ava, in the order, power, and general form of its letters greatly resembling the Sanscrit.

BASTARD or **MONGREL,** first made by a German named Heilman, in 1490, was in common use in France, in the fifteenth century; so called because it was derived from the Lettres de Forme, or Gothic character; but it has most of its angles cut off or diminished. Fournier gives four varieties of this bastard character.

BATTA, one of the most extensive languages in the island of Sumatra.

BENGALLEE, the alphabet of Bengal, very similar to the Sanscrit.

BULGARIAN, a character similar to that of the Illyrian.

BULLANTIC or **IMPERIAL,** an alphabet of ornamented capitals, so called because it was employed in writing the papal bulls.

CADEAUX, flourishing capitals, that were used in French writing of the fifth century.

CADMEAN, the original Greek alphabet, supposed to have been first introduced into Greece by Cadmus.

CHALDEE. alphabets can scarcely be distinguished from the Phœnician or Syriac. Several have been ascribed by the Rabbin to Adam, Enoch, Noah, &c. Its character, as at present known, is that of the Hebrew.

Of **CHARLEMAGNE,** the name of three alphabets attributed to the emperor Charlemagne, by whom they are said to have been introduced, at the commencement of the ninth century, for the purpose of improving the letters used in his dominions.

The **CHINESE** language has no literal alphabet, but consists of 214 key-words, or radical characters, that serve to form 80,000 characters, of which it is composed.

COPTIC, so called from Coptos, in Egypt, a mixture of Greek and Egyptian. There are two characters under this name, one of which is the ancient, and the other the modern Coptic. The latter, consisting of thirty-two letters, is only to be met with in the books of Egyptian Christians, by whom it was used in the translation of the Sacred Writings. *Kircher. Edip. Egypt. et Copt.; Pocock. in Not. ad Spec. Hist. Arab.*

CROATIAN, a variety of the **ILLYRIAN** alphabet, which see

DALMATIAN, said to have been invented by St. Jerome. *Duret. Tresor. des Lang. &c. p. 738.*

DORIE, a variety of the ancient **GREEK.**

Egyptian. Ancient Egyptian characters were

of three kinds; namely, *ἰπισολογραφικός*, or vulgar; *ἱερατικός*, or sacred; and *ἱερογλυνθικός*, hieroglyphic. Vestiges remain of them all, of which only conjectural explanations can be offered. Their letters are in all probability lost. The Coptic is the only Egyptian character that remains. *Herod. l. 2, c. 36; Diodor. Sic. l. 3; Herod. l. 5; Eustath. ad Hom. Il. 6, v. 168.*

ENGLISH, Old, or Black Letter, called by the French, *Lettres de Forme*, was first used by Gutenberg and Faust, at Mentz, and by them denominated *Lettres Burgeoises*.

The **ETHIOPIC, AMHARIC, OR ABYSSINIAN** alphabet, is evidently derived from the Samaritan or Phœnician; only, contrary to the Oriental custom, it is written from right to left.

ETRUSCAN was the earliest alphabet used in Italy, so called from the Etruscj, the most ancient inhabitants of that country. It is a sort of Pelegian or Arcadian character, frequently found on coins, and disposed after the Greek fashion, βατροφηδον, i. e. alternately from left to right, and from right to left. Two other alphabets are attributed to the Etruscans, which were used as sacred characters by their priests.

FLEMISH is the proper alphabet of the Austrian and French Netherlands, and is used in their common printing, which resembles the old English.

FRANCO-GALLIC, so called from its being a mixture of French and Gaulish characters, was used under the first race of the kings of France in their public acts.

FRANKS, an alphabet used by the earliest inhabitants of the Low Countries, and afterwards transferred to Gaul, was a variety of the Latin alphabet. Another alphabet under this name belonging to the Lingua Franca, is a kind of jargon spoken on the shores of the Mediterranean; the characters of which are composed of French, vulgar Greek, Spanish, and Italian.

FRENCH, ANCIENT, an alphabet of this name was used in the fifth century, under the first race of the French kings.

The **GEORGIAN** is an alphabet which consists of four different characters; namely, ancient Georgian; immediately derived from, and nearly allied to, the Greek; two, called sacred, consisting of capitals and small letters; and the fourth, a writing-hand of the Georgians.

GERMAN consists of two characters, capital and small letters, which are used for printing, and two also for writing, or the current-hand.

GOTHIC. To Ulphilas, a bishop of the Goths, in 388, is attributed the most ancient alphabet of this name. It bears a strong affinity to the Runie; a second Gothic alphabet is formed from the Greek and Latin; a third, attributed to Albert Durer in the sixteenth century, is very similar to the German.

GOTHIC, MODERN, an old English or Norman character, called in French, *les Lettres Tourneures*. It was much used in adorning the missals of the Romish church.

GREEK. We have seen the testimony of Herodotus, (similar to that of Pliny, Plutarch, and others,) that Cadmus, the Phœnician, introduced the first Greek alphabet into Bœotia, where he

settled B. C. 1500; although Diodorus is of opinion that the Pelasgian letters were prior to the Cadmean. From comparing the Cadmean and Pelasgian alphabets, however, with the Phœnician, it is clear that they sprung from one and the same origin. The Cadmean, or, as it is otherwise called, the Attic or Ionic alphabet, is principally found on coins and medals, the Pelasgian is drawn from the Eueubian tables: the former consisted originally of only sixteen letters, to which eight others were afterwards added; the number of the latter varies, according to the account of different writers, from twelve to twenty letters. The next Greek alphabet of ancient times is the Sigean, so called because the letters which composed it are taken from the inscription on a marble pillar near the town of Sigeum. The antiquity of this alphabet is evinced by its being read alternately from left to right, and from right to left, which manner of writing was called *βετροφηδον*, because it resembled the turning of oxen at both ends of a furrow. It is besides observable that the II for the long E, and the Ω for the long O were not then in use, but afterwards introduced by Simonides. Other Greek characters are drawn from medals and inscriptions; namely, the Nemean, B. C. 430, engraven on marbles, as is supposed, before the Peloponnesian war; the Delian, from inscriptions on the remains of a stately building on Mount Cythrus, in the island of Delos; the Athenian; and the Teian. About 500 years before the Christian era, Simonides completed the Greek alphabet, called the Ionic; and other Greek alphabets of different ages are—one used in the time of Alexander the Great, B. C. 330; another drawn from the coins of the Antiochis, kings of Syria, &c. B. C. 240 to 187; that of Constantine the Great, A. D. 306; of Justinian the Great, A. D. 527; of Heraclius, A. D. 610; of Leo Jaurus, A. D. 716. To these may be added that of the Alexandrian MS. of the New Testament. See ALEXANDRIAN MANUSCRIPT, for a specimen.

HEBREW. The Rabbins attribute the invention of two Hebrew alphabets to Solomon. Those most worthy of note are the ancient and modern Hebrew, the former of which is supposed to have been invented by Esdras after the captivity, and to have given rise to the latter. This question, however, has undergone much discussion among the learned, both Jews and Christians; but while the two Buxtorfs contend that the Hebrew now in use was that in which Moses wrote, the prevailing opinion is, that the Samaritan or Phœnician was the original Hebrew character, and that the present alphabet was invented after the captivity. Pl. III. MISCELLANEOUS, contains specimens of Samaritan inscriptions on coins, which it is admitted were struck prior to captivity. Fig. 1, represents the censer on the obverse, and, on the reverse, Aaron's rod budding; the inscriptions, the 'Shekel of Israel' and 'Jerusalem the Holy.' The first, which has **ג** over the censer, was a half shekel; the second having **נ**, the third of a shekel; and the third also having **נ** the fourth of a shekel. The Rabbinical Hebrew

is the current hand in use among the Jews at present.

THE HUNS, an alphabet so called because used by the Huns, who settled in Pannonia, or Hungary, in 370.

JACOBITE, a corruption of the Greek alphabet, used by the Jacobites, an heretical sect, in their religious services.

JAPANESE consists of three characters; namely, two that are in common use, and one that is used only at court. Like the Chinese, it is written from top to bottom.

ICELANDIC, the same as the Runic.

ILLYRIAN. There are two alphabets of this name; one said to have been invented by St. Cyril, and the other by St. Jerome, or, according to Aventinus, by one Methodius, a bishop of Illyrium, who used it in the translation of the Scriptures: the former bears a great affinity to the Russian, the latter to the Dalmatian. *Duret. Tres. des Lang.* p. 741.

INDIAN, the same as the Ethiopian. Duret mentions another Indian alphabet, which is generally used among the Easterns.

THE IRISH alphabet bears, in the opinion of Vallancy, a great affinity to the Phœnician, from which he supposes it to be derived. The Irish also used mysterious alphabets in their incantations, after the manner of those given under the name of ogums, from oga and ognia, an augury. Their three principal ogums, were the ogum Beath, when bt or beath was placed always for the letter a; ogum coll, when, for vowels, diphthongs, and triphthongs in the ogum, the letter e was variously repeated; ogum croabh, or the virgular ogum, having a line or stem called the croabh, through which, on each side, are drawn perpendicular strokes.

KUFIC, the ancient Arabie. See ARABIC.

LATIN, from the ETRUSCAN, which see. This alphabet underwent successive changes, until it arrived at its present state, in which it is more generally known by the name of Roman.

The **LOMBARD** is also a variety of the Latin character.

MESO-GOTHIC, an alphabet attributed to Ulphilas, bishop of the Goths, in the ninth century, and used in the translation of the Scriptures.

MALABARIC, an alphabet consisting of sixteen vowels, and thirty-five simple consonants or radicals. *Alphabet Var. Congregat. de Propagand. Fide*, vol. ii.

MALAYAN is a character similar to the Arabic.

MANTCHON, a sort of Tartaric. See TAR-TARIC.

MENDEAN, an alphabet used by the Mendes, a people of Egypt, A. D. 277; formed from the Syriac.

MONK'S, a mode of writing among the ancient Britons by cutting letters upon sticks, either in a square or triangular form, very similar to that which is given as a specimen of the Welsh or Bardic alphabet.

NORMAN. Two alphabets are given under this name on the authority of Bede, one of which was a variety of the Greek.

PALMYRIAN was first decyphered by the Abbe

Bartheleme, is read from right to left. It bears a strong affinity to the Hebrew.

PELASCIAN is a name given to the alphabet which the Greeks derived from the Phoenicians, whom they called Πελασγοι, Pelasgi, quasi Pe-lagi, from πελαγος, the sea, because they traversed the ocean for the purposes of commerce.

PERSIAN, Modern, is nearly the same as the Arabic alphabet, except the addition of four letters, and a few slight differences in the powers given to the letters. Hyde gives an ancient character called Zend or Pazard, and supposed to have been used by Zoroaster. *Hyde de Religion. Vet. Persar.*

The **PHOENICIAN** alphabets comprehend a great variety of characters, drawn generally from coins or inscriptions, and as ancient characters as any in the world. Scaliger supposes this to have been the original Hebrew character, otherwise called the Samaritan.

RUNIC, a variety of the Mæso-Gothic, used by several nations of the North.

The **RUSSIAN** alphabet is evidently derived from the Greek.

SAMARITAN is the name given to that variety of Phœnician character, which is supposed to have been used by the Jews from the time of Moses to the captivity. See *Hr. Raw.* This name was given to it, because the Samaritans continued to use it, after the captivity, in writing the Pentateuch. It has been collected by Walton from coins and inscriptions: the modern Samaritan differs somewhat from the ancient.

SANSKRIT. The alphabet of the Sanskrita, i. e. the perfect or polished language of the Hindoo class, is called also the Devanagari.

SARACEN. The Saracen alphabet, used at the time of their conquests, bears some affinity to the Phœnician. Another alphabet under this name is quoted by Morton, on the authority of Kircher, which is very similar to the Arabic.—*Duret. Tres. des Lang.* p. 475.

SAXON consists of two characters, the ancient and modern.

SCLAVONIAN, the alphabet used by the ancient inhabitants of Sclavonia, and which bore some resemblance to the Illyrian.

SERVIAN, an alphabet bearing some resemblance to the Greek, is attributed to St. Cyril, A. D. 700; and other characters, under this name, to St. Jerome.

SIAMIC is an alphabet bearing affinity to the Chinese.

STRANGELO, the ancient Syriac, from the Greek στρογγυλος, round, or rather, rude and rough, said to have been in use, B. C. 300. The modern Syriac, consists of initials, medials, and finals, like the Arabic. From this character two others were formed, called Nestorian, from the Nestorians of Syria, but differing only in some slight particulars. A fifth and sixth sort of Syriac have been given under the names of Syro-Galilean and Syro-Hebraic.

SUMATRAN. The dialects of Sumatra have each a peculiar alphabet, of which Marsden has taken notice in his Comparative Vocabulary, as the Batta, Lampoor, Rejang, &c.

TALENGA, an alphabet of the kingdom of Decan, similar to the Malabaric.

TAMOULIC, an alphabet of India, much used in letter-press printing.

TARTARIC, the same as the Arabic; but the Manchou Tartar is a different character.

TEUTONIC, a northern alphabet, bearing considerable affinity to the Saxon.

THIBETAN, the alphabet used by the Lamas, according to the ‘Alphabeta Varia Typis sacra Congregations de Propaganda Fide.’

TURKISH is the same as the Arabic, with the addition of five letters.

WELSH, (*Cœlbreñ y Beirs*, i. e. the Bardic alphabet,) consisted of sixteen primitive or radical characters, and twenty-four secondary ones. It was formed by cutting the letters on a stick in a triangular or square character.

The learned author of *Hermes* states, that to about twenty plain elementary sounds, we owe that variety of articulate words which have been sufficient to explain the sentiments of such an innumerable multitude as all the past and present generations of men. Mr. Sheridan says, that the number of simple sounds in our tongue are twenty-eight; while Dr. Kenrick contends, that we have only eleven distinct species of articulate sounds, which even by contraction, prolongation, and composition, are increased only to the number of sixteen; every syllable or articulate sound in our language being one of the number. Bishop Wilkins and Dr. William Holder speak of thirty-three distinct sounds.—After the analysis or decomposition of language into the elementary sounds, the next step towards the notation of it by alphabetical characters would be the delineation of a separate mark or letter to represent each sound; which marks, though few in number, would admit of such a variety of arrangements and combinations, as might be capable of producing that infinity of articulate sounds which compose language. The ingenious Wachter, in his *Nature et Scriptura Concordia*, p. 64, endeavours to show, that ten marks or characters are sufficient for this purpose. From a calculation made by Mr. Prestet, it appears, that, allowing only twenty-four letters to an alphabet, the different possible words that may be made out of those letters, would amount to the following number, 1391,724,288,887,252,999,425,128,493, 402,200! Of all known languages, the Greek has been regarded as one of the most copious, the radices only of which are estimated at about 3244; but then it abounds so exceedingly in compounds and derivatives, that Wilkins thinks they may be moderately computed at about 10,000. Hermanus Hugo asserts, that no language has so few as 100,000 words; and Varro is frequently quoted by learned men, as having affirmed that there are in the Latin no less than 5,000,000; reckoning all the variations of nouns and verbs by composition, conjugation, declension, and inflection.

Bishop Wilkins charges all the alphabets extant with great irregularities, in respect to order, number, power, figure, &c. The order of them certainly appears inartificial, precarious, and confused: and even in the Hebrew alphabet there are letters both redundant and deficient. Most known alphabets are redundant, either by allotting several letters to the same power and

sound, as in the Hebrew **בּ** and **וּ**, and the ordinary Latin *c* and *k*, *f* and *ph*; or by reckoning double letters among the simple elements of speech; as in the Hebrew **שׁ**, the Greek **ξ** and **ψ**, the Latin *x*, *z*, and *j* consonant: and deficient, in various respects, especially in regard to vowels, of which there are seven or eight kinds commonly used, though the Latin alphabet only takes notice of six; besides which, the difference among vowels, in respect of length or brevity, is not sufficiently provided for: the ancients, we know, used to express a long vowel, by doubling its character, as *amuuabum*, *nuata*, *ree*, *seedes*; and the vowel *i*, instead of being doubled, was frequently prolonged, as in **ΞΕΙΛΙΣ**, **ΠΙΣΟ**, **ΙΙVUS**. The method used in English for lengthening and abbreviating vowels, viz. by adding *e* quiescent to the end of a word, for prolonging a syllable; and doubling the following consonants, for the shortening of a vowel, are equally improper; because the sign ought ever to be where the sound is. Again, their powers are not always fixed; the vowels, for instance, are generally acknowledged to have each of them several sounds: thus the vowel *i* has at least three different sounds, and one of these only is expressed in writing no less than in six several ways, viz. by *c*, as in *he*; by *ee*, as in *three*; by *ie*, as in *field*; by *ea*, as in *near*; by *eo*, as in *people*; and by *i*, as in *privilege*. Nor are the consonants of more determinate power; witness the two different pronunciations of the same letter *c* in the same word *circō*; and of *g* in *negligence*. To add no more, the letters *c*, *s*, and *t* with an *i* after it, are used alike to denote the same power; and the letter *s* is commonly used for *z*; and which is yet worse, some letters of the same name and shape are used at one time for vowels, and at another for consonants; as *j*, *v*, *w*, *y*; which yet differ from one another, says bishop Wilkins, *sicut corpus et anima*; ‘as much as soul and body.’—From this confusion in the power of letters, there arise divers irregularities; such as, that some words are distinguished in writing, which are the same in pronunciation, e. gr. *cessio* and *sessio*, &c. and others are distinguished in pronunciation, which are the same in writing; as *I now read—I have read*, &c.

Various plans have been suggested to remedy these imperfections, and very plausible schemes have been exhibited for that purpose, by Mr. Lodwick, Bp. Wilkins, Dr. Franklin, &c.; but the great difficulty, if they should be ever so perfect, lies in bringing them into general use. Mr. Sheridan observes, that, in our English alphabet, there are many sounds for which we have no letters or marks: and that there ought to be nine more characters or letters to make a complete alphabet, in which every simple sound should have a mark peculiar to itself. The following is his scheme of the English Alphabet. *Rhet. Gram.* p. 9.

Number of simple sounds in our tongue 28.
 9 Vowels, ^{3 1 2 3 2 3 1 1 1}
^w ^u ^a ^o ^e ^o ^o ^e ⁱ ^u
 hall hat hate bee note noose bet sit but
^w short oo short ee
 19 Consonants, { b d f g k l m n p r s t v z th
^y sh zh ng.

- 2 Superfluous, *c*, which has the power of *k* or *s*; *q*, that of *k* before *u*.
 - 2 Compound, *j*, which stands for *dzh*; *z* for *ks* or *gz*.
 - 1 No letter, *h*, only a mark of aspiration.
- Consonants divided into mutes and semivowels.
- 6 Mutes, *b d g k p t*.
 - 3 Pure mutes, *k p t*.
 - 3 Impure, *b d g*.
 - 13 Semivowels, { *f l m n r s v z th zh ng*.
or liquids.
 - 9 Vocal, *l m n r v z th zh ng*.
 - 4 Aspirated, *f's t'h sh*.

Divided again into

- 4 Labial, *b p r f*.
- 8 Dental, *d t th zh ss zh csh*.
- 4 Palatine, *g k l r*.
- 3 Nasal, *m n ng*.

ALPHÆA, in entomology, a species of the phæna *bombyx*, with ferruginous wings, a white point in the middle, and a punctuated brown streak;—found in New Holland.

ALPHENUS VARUS. See **ALFERNUS**.

ALPHERATZ, in astronomy, a fixed star of the third magnitude in Aquarius.

ALPIERY (Mikipher), a native of Russia, and of the imperial line. When that country was torn in pieces by intestine quarrels, in the latter end of the 16th century, this gentleman and his two brothers were sent over to England under the care of a Russian merchant, who entered them at Oxford, where two of them died of the small pox. This surviving brother entered into orders; and in 1618 obtained the rectory of Wooley in Huntingdonshire; and though twice invited to return to his native country by a political party, he chose rather to remain with his flock. In 1643 the republicans took him by force from his pulpit, as he was preaching, and turned his wife and children into the street. He raised a tent in the church-yard, over against his house, and lived there with his family for a week. Mr. Alphery afterwards left Huntingdonshire, and resided at Hammersmith till the restoration again put him in possession of his living; but, being aged and infirm, he could not perform its duties; and having settled a curate, retired to his son's house at Hammersmith, where he died.

ALPIESIBEA, 'Αλφεσιβοία, in mythology daughter of Phlegeus, and wife of Alcmaeon, the son of Amphareus, abandoned by her husband for Calirhoe, the daughter of Achelous. He attempted to obtain a necklace from her which she had received as a bridal present, and was killed by her brothers in revenge.

ALPIESTES, in ichthyology, the name of a fish, the *cinclus* of Linnaeus, seeming to approach very much to the *turdus* or *wrasse* kind, but having the rays of its back-fin prickly all the way to the tail; whereas the *turdī* have only the anterior rays of that fin prickly, the rest smooth. It is a small fish, caught about the shores, and among rocks; its back is purple, and its sides and belly yellowish. Its mouth is small, and has thick and fleshy lips.

ALPHETI, in astronomy, another name for the star *Lucida Corona*.

ALPIEUS, or **ALPHEIUS**, in ancient geogra-

phy, a large river of the Peleponnesus; which, rising in, and after several windings running through, Arcadia, and by Olympia in Elis, with a south-west course fell into the Sinus Cheloniates, about ten miles south of Olympia. It had a common spring with the Eurotas, at the foot of mount Parthenius, near the village Asea. The poets fabled that, out of love to the nymph Arethusa, this river ran under the sea to Sicily, and burst out again at the fountain of that name in Syracuse. Pausanias adds, that the Eleans had a law, which condemned any woman to death that should either appear at the Olympic games, or cross this river during that solemnity. Virgil alludes to this stream in the following lines :

Alphæum famæ est hue Elidis amne
Occulta egisse vias subter mare ; qui nunc
Ore, Arethusa, tuo Siculis confunditur undis.

And Lord Byron has a beautiful application of the above fable, as a metaphor, in his Lara.

ALPHÆUS, the father of the apostle James and Jude. Mary, his wife, is said to have been the sister of the Virgin, and hence some writers say his sons were called the brethren of our Lord. He is supposed to be the same with Cleophas. Also the name of the father of the Evangelist Matthew.

ALPHITIDON, fr: m *ἀλφίτον*, powder, i.e. a bone ground to powder. In surgery, a species of fracture, wherein the bone is broken into a great number of small parts, or portions.

ALPHONSIN, in surgery, an instrument for extracting bullets, or other extraneous substances, from the human body. This instrument derives its name from the inventor Alphonsus Ferrius, a physician of Naples; and consists of three branches, which are closed on a ring. When introduced into the wound, the operator draws back the ring towards the handle, upon which the branches opening, the ring is pushed from the haft, by which means the ball is grasped firmly, and extracted from the wound.

ALPHONSINE TABLES, astronomical tables made by Alphonso X. (See ALPHONSO X.) They were drawn up chiefly by the skill and pains of a learned Jew, rabbi Isaac Hazan, and called Alphonsine Tables in honour of this prince, who was at considerable expense concerning them. He fixed the epoch of the tables to the 30th of May, 1252, being the day of his accession to the throne. They were printed for the first time in 1483, by Radolt, of Venice; (an edition extremely rare;) there are others of 1492, 1521, 1545, &c.

ALPHONSO, or ALPHONSIUS, I. king of Aragon and Navarre, succeeded his brother Pedro I. in 1104; and in 1109 became king of Castile by his marriage with Urraca, daughter to Alphonso VI. king of Castile and Leon. He took Saragossa from the Moors; but his queen proving faithless, he divorced her, which involved him in wars with the Castilians. He died in 1124.

This was also the name of several monarchs of Arragon, Leon, and Castile, who variously distinguished themselves in contest with the Moors in the 12th and 13th centuries.

ALPHONSO X. king of Leon and Castile, was surnamed the Wise, and author of the astronomical tables, called Alphonsine. The perusal of

Quintus Curtius is said to have afforded him such delight, that it gave a favourable turn to a dangerous illness. He is said also to have read the Bible fourteen times, with several comments on it; and favoured its translation into the Spanish language. He also completed a code of laws, known under the title of *Las Partidas*, begun by his father, and substituted the vernacular tongue for the Latin in law proceedings. He was elected emperor in opposition to Richard, duke of Cornwall, and was excommunicated by the pope for persisting in his claim to that dignity. Dethroned by his son Sancho: he died of grief, in 1284.

ALPHONSO XI. king of Leon and Castile, succeeded his father Ferdinand IV. in 1312. He defeated and slew Abdulmalic, son of Abul Hassan, king of Fez, in 1339; and at the battle of Tariff, in 1340, obtained a signal victory over the Moors, of whom it is said 200,000 were slain; besides taking Algezira from them: he died in 1350.

ALPHIUS, in medicine, a distemper, described by Celsus, under the name of vitiligo. In this disease the skin is rough, and exhibits spots of white; whence it is denominated leuce. Where the spots are black, it is called nigra and melanæ. It bears the same relation to the leuce, as the scabies to the icpra; the first is superficial and cutaneous, the second sinks deeper into the flesh.

ALPINE MOUSE. See MOUSE and MARMOTÆ.

ALPINI, or **ALPINUS**, (Prosper), a celebrated Venetian physician and botanist, born in 1553. He travelled in Egypt to acquire a knowledge of exotic plants, and was the first who explained the fructification and generation of plants by the sexual system. Upon his return to Venice, in 1586, Andrew Doria, prince of Melfi, appointed him his physician; until the republic of Venice, being jealous that so distinguished a subject of theirs, as Alpini, should continue at Genoa, invited him in 1593, to fill the professorship of botany at Padua. He discharged this office with great reputation, till he died in 1616, in the 64th year of his age. His principal works (which have passed through numerous editions), are *De Medicina Ægyptiorum*; *De plantis Ægypti*; *De Balsamo*, a treatise on the famous balm of Gillead; *De Prasagienda Vita et Morte Ægyptorium*, consisting chiefly of a collection and arrangement of the presages of Hippocrates; *De Medicina Methodica*, being an attempt to elucidate and restore the ancient doctrine of the Methodistic sect in medicine; *De Raphontico disputatio inauguralis*; and *De Plantis exoticiis*.

ALPINIA, in botany, a genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the 8th order, scitamine. The characters are: cal. a perianthium above, small, and trifid: cor. monopetalous, unequal, and as if doubled: stam. one filament, with linear antheræ joining to the margin: pist. a roundish germen, beneath: the stylus simple, and the stigma obtusely trigonous: per. is a fleshy ovate trilocular capsule, with three valves. The seeds are ovate, and very numerous; the receptaculum is pulpy and very large. Of this genus, various species, natives of the East and West Indies, have been lately

enumerated by Mr. Roscoe, Dr. Roxburgh, and others, but they have not been very intelligently described. It grows naturally in moist places.

ALPS or ALPES, a long and stupendous ridge of mountains, which lie almost in the very heart of continental Europe, and stretching in a crescent-like form through Provence, Dauphine, Savoy, Switzerland, the Tyrol, Trent, Brixen, Suabia, the Electorate of Saltzburg, Carinthia, Carniola, and the ci-devant republic of Venice, from the Gulf of Genoa to the top of the Adriatic, divides Italy, on the north, from Germany, France, and Switzerland. The name is supposed to be derived either from the Celtic alp, signifying verdant heights, or mountains, (Isidore in Origin, lib. iii. and Servius in Virgil, Aen. lib. iii.); and, amongst the ancient Scythians and Scandinavians, the spirit of a mountain; or from albus, alpus, white with snow. The etymology from Albion, the son of Neptune, who was said to have been killed by Hercules, when disputing the passage of this god across these mountains, is too fabulous, if not for our attention, at least for our belief.

The length of this lofty range is from 600 to 700 miles, and its breadth, variously estimated, in some places exceeds 100, the whole comprising various chains or branches, broken into lofty peaks, and divided from each other by narrow valleys, and dreadful chasms several thousand feet deep. Many of these stupendous masses appear like mountains piled upon mountains, till their summits reach above the clouds, and at that altitude resemble islands emerging from the bosom of the ocean. These are chiefly from 4000 to 12,000 feet in altitude above the level of the sea, and form a series of summits, the highest of which are clothed with perpetual snow. The most rugged parts of this chain are those lying between Savoy and the Vallais, amongst which the celebrated Mont Blanc lifts its lofty head to the enormous altitude of 15,600 feet, and is visible from Dijon and Langres, at the distance of 140 miles. From these immense heights, numerous lakes and rivers derive their origin, down their sides are poured stormy cataracts, and beautiful cascades, whilst fine views, and scenes the most picturesque and delightful, break from various directions upon the eye of the traveller. The lower parts of these mountains are clothed with woods and pastures; the superior regions, to which the shepherds resort with their flocks during summer, produce a great variety of plants and shrubs, and are refreshed with clear and excellent springs, whilst the supreme altitude presents a series of rugged and almost inaccessible rocks. In ascending the Alps, the traveller experiences not only the four seasons in succession, within a short space of each other, but all the intermediate changes. Even summer and winter here lose their animosity, and dwell almost together. Many parts of the Alps, especially the middle regions, are subject to violent storms, the tremendous effects of which on the northern branches are fearfully felt. Within the space of a few hours, these dreadful *acirs*, or hurricanes, often fill the ravines, obliterate the paths and precipices, cover the villages, bury the inhabitants, and deplorable is the state of that traveller who is thus

overtaken at a distance from any shelter—his path is no longer visible—the precipice and the plain can no longer be distinguished—if he stands, he is frozen—if he proceeds, he is buried.

Since the time of the Romans, who first penetrated these mountains thoroughly, they have been called by different names in different parts. The principal subdivisions are the following:—the Maritime, the Cottian, the Greek or Grecian, the Pennine, the Rhaetian, distinguished into the High Alps, the Leontine, and the Rhaetian Proper; the Tyrolese and Tridentine, including those of Suabia, the Noric, the Carnic, and the Julian.

In the course of this immense range, these mountains assume several distinct names and subdivisions, according to their different and relative situations. The Maritime Alps, or Alpes Littoræ, or Maritimæ, so called from their proximity to the Mediterranean, begin at the eastern extremity of the chain, near Monaco, and terminate near the source of the Po, at Mount Viso, between Dauphine in France, and Piedmont in Italy; thus connecting the Alps with the northern part of the Appennines, and leaving ancient Gaul to the west, and Genoa to the east. Sausure has included the whole range of mountains, from Nice to Genoa, under this subdivision, which he divides into two great branches, one running eastward along the coast, until it joins the Appennines; the other stretching westward through Provence: the usual distribution, however, gives the eastern branch of this range to the northern Appennines. The heights of Camelon and Tenda are the most celebrated and conspicuous of this division, both situated in the county of Nice; and the passes called the Col di Tenda, the boundary of Nice on that side, and the Col d'Argentiere, leading from Barcellonette in Provence, to Coni, in Piedmont, are those best known to travellers. The ancient city of Embrun was formerly the capital of this district, the inhabitants of which enjoyed, under the emperor Nero, the privileges appertaining to the allies of Rome; and trophies are said to have been erected on one of its highest summits, called Tropea, or Turbia, in honour of the emperor Augustus.

The Cottian Alps, Alps Cottiae, or Cottanæ, now Mont Genevre, begin at Mount Viso, at the termination of the former, and taking a northern direction to mount Cenis, form the boundary line between this part of Dauphine and Piedmont. The chief town of this district is Susa, and across this range it is supposed, by Holstenius, D'Anville, and others, that Hannibal with his army entered into Italy. This, however, is by no means clear. The manner in which the Carthaginian general levelled some of the most inaccessible heights, splitting the rocks by means of fire, and afterwards pouring on quantities of vinegar, which are said to have softened and crumbled them, rests entirely upon the authority of Livy, l. xxi. c. 27, supported by an extravagant line of Juvenal, Sat. x. v. 15. 'Diducit scopulos, et montem rumpit aceto.' In the present advanced state of chemistry, we know nothing of a calcination of immense masses of rock that could be thus effected. Pliny states,

in book xxii. c. 1. of his Natural History, that vinegar will dissolve calcined substances, and the pearl of Cleopatra may be instanced as a proof of this; but the details of natural history are so imperfectly given by the ancients, and Pliny is himself so full of marvellous relations, that this evidence can weigh but little; and even allowing the fact to be correct, as to the pearl, the dissolution of so small a substance can bear no analogy to softening down the rocks of the Alps. There is, however, still extant an ancient pass on this division of these mountains, which leads from Briançon to Susa, formerly called the Cottia; by which, if Hannibal passed over this portion of the Alps, he must have proceeded.

The Greek Alps, or, according to Pliny and Cornelius Nepos, *Alpes Graiae*, begin at the northern part of the range last described, and divide Savoy and the Tarentese territory in a western direction; they also run to the east, between Piedmont and the valley of Aosta, terminating at Great St. Bernard. This division is sometimes called Little St. Bernard, as it contains that mountain, and is the part where Hercules, on his return from Spain, was fabled to have forced his passage against Albion.

The Pennine Alps, or *Alpes Penninae*, seem to have derived their name from the Celtic word *Pen*, signifying head or top, in relation to the comparative heights of these mountains. The etymology which derives the name from *Pæni* (Carthaginians), as denoting it to have been the place of Hannibal's passage, is inconsistent with the tenor of history, although conjectured in the time of Livy, lib. xxi. This division begins at the north-east of the *Alpes Graiae*, and, separating the Vallais from Italy on the south, extends to the sources of the Rhine and the Rhone, at the foot of the Great St. Gothard. There are three roads across these mountains; that by which the emperor Constantius marched his army against the Alemanni; another over Mount Simplon, by which Buonaparte invaded Italy, in 1800, prior to the battle of Marengo. This great road into Italy was highly improved by the ci-devant emperor, and is that usually travelled. It runs along the Savoy side of the lake of Geneva, and connects the ridge of the Jura with the Alps. At St. Maurice it falls in with the road that traverses the Swiss margin of the lake, passes up the Vallais beyond Sion; and then turning to the right ascends the Great Simplon, and conducts the traveller to the lake Maggiore and Milan. The track, at the town of Martigni, is unworthy the name of a road, and is passable only by mules. It branches off to the Furca, the Col de Balme, and the romantic scenes of the vale of Chamouni. This division contains Great St. Bernard, Mont Blanc, and that immense range of precipices extending southward from the Rhone, and northward from the modern Piedmont. Here the Alps assume their greatest breadth, and branch out into those enchanting valleys which form the habitations of the Swiss.

The Rhætian Alps, or *Alpes Rhæticae*, are so called from their situation in the ancient Rhætia. Of this range there are three subdivisions: first, the Rhætian Alps proper, which form an immediate junction with the Pennine Alps, and pass

between the country of the Grisons and the Tyrol, to the sources of the rivers Piave and Drave, and in their course give rise to the Inn, the Adige, the Oglio, and the Adda; second, the High Alps, designating the summits of St. Gothard, the Vogelsberg, the Furca, the Crispalt, the Schreckhorn, and the Grimsel, which they contain. This chain runs from St. Gothard to the lake Maggiore, and divides Milan from Switzerland. In its course, a branch of the river Rhine springs from the mountain Vogelsberg, and the sources of the Rhone and the Reuss are to be found in the mountain of Furca. This subdivision is sometimes called the Helvetian Alps. The third, or Lepontine Alps, take their name from the inhabitants of the surrounding country, extend southward of the Pennine Alps and of the High Alps, and stand between the sources of the Rhone and the lake Maggiore, joining the Great St. Bernard westerly.

The Tyrolese, or Tridentine Alps, *Alpes Tridentinæ*, run northward of Trent, and include the great mountain Brenner; the Alps of Algou, in Suabia, are a part or continuation of the Tyrolese Alps, and cannot justly be divided from it; within this range, in the county of Konigseck-Rothenfels, stands the Hochvogel, and here the rivers Lech, Iller, Bregenz, and the Aller, derive their several sources.

The Noric Alps, or *Alpes Noricae*, take their name from the ancient Noricum, and divide the counties of Nice, Saltzburg, and the territory of Venice. They extend eastward of the Rhætian Alps, and terminate at Dolback in the Tyrol.

The Carnic Alps, or *Alpes Carnicae*, which have been little explored, extend from the Noric Alps to mount Occa, running between Carinthia and Friuli.

The last distinct portion of these mountains is that known by the different names of the Julian, Pannonian, or Venetian Alps; *Alpes Juliae*, from Julius Cæsar, who formed a plan of a road over them, afterwards completed by the emperor Augustus. The additions of Pannonicæ or Venetæ are derived from the counties of Pannonia and of Venice, through which they run. This division of the Alps continues the chain from Mount Occa to the gulf of Carnaro, in the Venetian gulf, or Adriatic sea, near Istria, and running between Carinthia, Carniola, and Friuli, completes the crescent before described.

The Alps, according to Saussure, consist, in their higher summits, chiefly of a large-grained granite. On the loftiest peaks, the sun sheds its lustre at setting, full three quarters of an hour after the light has disappeared in the Pays de Vaud, and other places in Switzerland, which stand more than 1000 feet above the sea. At the rising of the sun, the tops of these mountains are illuminated for an equal length of time before his rays reach the surrounding country, when they appear like stars amidst the darkness of the morning. The valleys and terrific precipices, on the sides of these heights, are interspersed by those beautiful, but dangerous wonders of nature, the glaciers, or rocky pyramids of ice, accumulated in these Alpine avenues in immense quantities, and in immense shapes and varieties. Cox divides them into

the upper and lower glaciers, of which the last are much the more considerable in extent and depth; that of Des Bois is fifteen miles long, and in some places upwards of three broad. Saussure found the average depth of the ice, composing this glacier, from eighty to a hundred feet. They seem, in the larger ravines, as if enormous multitudes of icy hills had rushed from the summits of the surrounding mountains, and crushed each other into the thousand forms that thus fill up the valley. Their surfaces are rough and granulated, the ice of which they are composed being remarkably porous and full of bubbles; they are easily passed, except in a rapid descent, and in the case of snow accumulating over the fissures, which, however, are not many, and always felt for by the guides. The upper glaciers, on the sides and summits of the Alps, are formed of the purest snow, converted into various degrees of hardness, and continually sliding downward to the valleys. The avalanches are prodigious masses of these accumulations, which are suddenly precipitated down the sides of the mountains, and, increasing as they proceed, sometimes overwhelm whole villages at their feet. The valleys themselves, nevertheless, present some of the finest landscapes to the eye, and afford the most luxuriant pasture; corn, vines, and fruits, diversify the scene, and excellent fish of all kinds are found in the waters. Recesses from the world are formed, by means of these mountains, in the very heart of Europe, which would seem designed to be the cradle of liberty; but the warrior and the statesman have often decided the fate of the civilized world upon their borders. Many parts of the Alps yet remain untraversed by the foot of man; but the most noted passes, besides those already mentioned, are those of Mount Cervin, Furca, Col di Seigne, Great St. Bernard, St. Gothard, Splugen, the Bulls of Rastat, and the Brenner. Tourists, in these districts, have multiplied the descriptions of particular passes, so that we shall not conduct the reader through any of the ordinary routes: Saussure, and the MM. Bourrit, have given us, perhaps, the only scientific accounts of the geological and mineralogical wonders of the scene; while Mr. Archdeacon Coxe, and other English travellers, have, no doubt, found their way to most of our readers.

A few additional extracts from varieties, descriptive of the most prominent features of Alpine scenery, will form the conclusion of the present article. ‘The prospects from many parts of this enormous range of mountains,’ says a late writer, ‘is extremely romantic, especially towards the north-west. One of the most celebrated is the Grande Chartreuse, where is a monastery, founded by St. Bruno, about the year 1084. From Echelles, a little village in the mountains of Savoy, to the top of the Chartreuse, the distance is six miles. Along this course the road runs winding up, for the most part not six feet broad. On one hand is the rock, with woods of pine trees hanging over head; on the other a prodigious precipice almost perpendicular; at the bottom of which rolls a torrent, that, sometimes tumbling among the fragments of stone which have fallen from on

high, and sometimes precipitating itself down vast descents with a noise like thunder, rendered yet more tremendous by the echo from the mountains on each side, concurs to form one of the most solemn, the most romantic, and most astonishing scenes in nature. To this description may be added, the strange views made by the crags and cliffs, and the numerous cascades which throw themselves from the very summit down into the vale. On the top of the mountain is the convent of St. Bruno, the superior of the whole order, which, though not of the first style of architecture, is not altogether without its effect upon the surrounding scenery.’

In the extraordinary narrative of M. Bourrit’s journey hither, we meet with the following account of the Prieure, in the valley of Chamouni. We had, says he, the magnificent prospect of a chain of mountains, equally inaccessible, and covered with ice; and above the rest that of Mont Blanc, whose top seemed to reach, and even pierce the highest region of clouds. The chain, upon which the mountain looks down like a giant, is composed of masses of rocks, which terminate in pikes or spires, called the Needles, and which are ranged like tents in a camp. Their sides appear lighter and more airy from the ornament of several hollow breaks and furrows fretted in the rock itself, as well as from the different streaks and panes of ice and snow, which, without changing the general character of their form, or the majesty of their appearance, give them a picturesque variety. Lower down, the eye surveys with ravishment the hills of ice, and the several glaciers, extending almost into the plain, whilst this appears like an artificial garden, embellished with the mixture of a variety of colours. We have a picturesque opposition to this chain, which is formed by innumerable mountains at the distance of near 50 leagues, between whose tops we have a glimpse of those several plains which they environ. M. de Saussure, who had visited those mountains about two months before M. Bourrit, felt himself naturally electrified in this place. This extraordinary phenomenon seems not to have been experienced by the latter or his company; but they heard a long continued rumbling noise, like that of thunder, which was rendered more awful by the silence of the place where they stood. This noise proceeded from the subsequent causes, viz. the avalanches of snow, which separated from the tops of the mountains, and rolled down to the bottom; considerable fragments of the rocks which followed them, overturning others in their fall; and massy blocks of ice, which precipitated from the summits. The valley of Montanvert appears to be peculiarly romantic. Here, says M. Bourrit, we beheld a spacious icy plain entirely level; upon this there rose a mountain all of ice, with steps ascending to the top, which seemed the throne of some divinity. It likewise took the form of a grand cascade, whose figure was beyond conception beautiful; and the sun which shone upon it, gave a sparkling brilliance to the whole. The valley on our right hand was ornamented with prodigious glaciers, which, shooting up to an immeasurable height between the mountains, blend their

colours with the skies, which they appear nearly to reach.

ALPS, SUABIAN, a chain of mountains, which stretch along the frontiers of Wirtemberg, in Germany, separating the Danube from the Neckar. They may be considered as a continuation of the Tyrolese Alps, forming part of the Schwarzwald, or Black Forest. They reach from Bultz to the vicinage of Tubingen, and then eastward as far as Ulm.

ALPS, MARITIME, department of, in France, is formed from the ancient county of Nice, and a certain part of High Provence. Nice is its chief town, and, with Puget and Herieres, forms three sub-prefects or arrondissements. It is divided into twenty-two cantons, and contains a population of 131,300 inhabitants. This is a mountainous district: but the valleys produce excellent wine and oil. It is in the eighth military division east.

ALPS, LOWER, department of, in France, is formed out of Provence High, or the north-east part of Provence, and of the valley of Barcelonette. Digne is the chief place. There are five arrondissements, or sub-prefectures, viz. Digne, Barcelonette, Castelane, Sisteron, and Forcalquier. The population is about 149,400, and its extent three hundred and seventy-two French leagues. It has the department of the Upper Alps to the north, to the east the Piedmontese Alps, the department of the Var bounds it on the south, and the mouth of the Rhone and Vaucluse on the west. It is also in the eighth east military division.

ALPS, HIGHER, department of, in France, is formed of the south-east part of Dauphine, and part of Provence. Gap is the chief place. There are three sub-prefectures or arrondissements, viz. Gap, Briançon, and Embrun. It is divided into twenty-three cantons, its extent is two hundred and fifty-one French leagues, and contains a population of 121,500 inhabitants. This department is fertile in corn, wines, and nut-oil, and on its hills sheep and goats abound. It is in the seventeenth east military division.

ALPS, is likewise frequently used as an appellation to denote any mountains of extraordinary height or extensive range. In this sense, Ausonius and others call the Pyrenean mountains Alps; and Cællius the Spanish Alps, Alpini Hispani. Hence also we say, the British Alps, the Asiatic Alps, the American Alps, the Scottish Alps, &c.

ALPTECHIIN, a Turkish slave of Achmet, sultan of the Samanides, who having obtained his freedom by his talents and address, rose gradually to the highest offices of state; and on the death of Achmet, obtained possession of the city of Gazna, where he reigned for 16 years, and at his death, was succeeded by his son-in-law, Sebecteghin, the father of Mahmud, the founder of the great Gaznian dynasty.

ALPUJARRAS, or ALPUXARRAS, mountains of Spain, in the province of Granada, on the coast of the Mediterranean sea. They are about 17 leagues in length, and 11 in breadth, reaching from the city of Velez, almost to Almeria. They are inhabited by the descendants of Moors who have embraced the Christian religion, but preserve their own manner of living and lan-

guage, though much corrupted. Here is a rivulet between Pitros and Portugos, which is said to dye linen that is dipped in it black in an instant. The Moriscoes cultivate the soil extremely well, and plant fruit trees; some of which grow to a prodigious height and thickness, and give the mountains an agreeable aspect.

ALQUIER, also called *cantur*, a liquid measure for oil, used in Portugal. It contains six cavadas, or canadors. Two alquiers make an almeede, or almonde. It contains 675 French, or 817 English cubic inches; so that 21 alquiers are nearly = 1 English quarter; or more correctly, 50 alquiers = 19 English bushels. Alquier is also a measure for grain at Lisbon.

ALQUIFOU, or ARQUIFOU, in mineralogy, a sort of mineral lead, very heavy, easily reduced into powder, though hard to melt. When broken, it parts into shining scales, in colour much like needles of antimony. The potters use it to give their works a green varnish, whence it is commonly called potter's ore. It is found in Cornwall: the potters mix manganese with it, and then the varnish or glazing on their wares becomes of a blackish colour.

ALRAMECH, or ARAMECH, in astronomy, the Arabic name of a star of the first magnitude, otherwise called ARCTURUS.

AL-RASCHID (Haroun), a caliph of Bagdad. See AARON.

ALRATICA, among the Arabian physicians, is where the vagina is imperforate, or at least the foramen smaller than ordinary, whether naturally or by accident.

ALRE, a river of England, rising near Alresford, below which it is called Itching.

ALREADY, *adv.* All ready, wholly ready, done, past.

For if the Wolfe come in the waine
Their gostly stafle is then awaie,
Whereof thei shuld their flocke defende.
But if the poure shepe offend
In any thyng, though it be lite,
Thei bren all ready for to smite.

Gower. Con. A. The Prologue.
Touching our uniformity; that, which hath been
already answered, may serve for answer. *Hooker.*

You warn'd me still, of loving two;
Can I love him, already loving you?
Dryden's Indian Emp'ror.

See, the guards from yon far eastern hill
Already move, no longer stay afford;
High in the air they wave the flaming sword,
Your signal to depart. *Dryden's State of Innocence.*

Methods for the advancement of piety are in the power of a prince, limited like ours by a strict execution of the laws already in force. *Swift.*

Methinks, already I your tears survey;
Already hear, the horrid things they say;
Already see you, a degraded toast;
And all your honour in a whisper lost! *Pope.*

ALREDUS, or ALUREDUS, of Beverley, a celebrated English historian, who flourished in the reign of Henry I. It is said that he was educated at Cambridge, and afterwards became canon and treasurer of St. John's, at Beverley. He travelled through France and Italy, for improvement, and at Rome became domestic chaplain to cardinal Othoboni. He died in 1128 or 1129, leaving behind him the following works: 1. The Annals of Alured of Beverley: Oxford,

1726; published by Mr. Hearne; from a manuscript belonging to Thomas Rawlinson, Esq. It contains an abridgment of our history, from Brutus to Henry I. written in elegant Latin, and with great accuracy. 2. *Libertates ecclesiae S. Johannis de Beverlac, &c.* a MS. in the Cotton library, which has never been published. It is a collection of records relative to the church at Beverley, translated from the Saxon language.

ALRESFORD, a market town and parish of Hampshire, in Alton North division, 57 miles from London, and 6 miles north-east from Winchester, containing about 1219 inhabitants. The church of Old Alresford is a neat building, to which the churches of New Alresford and Maidstead are chapelries annexed. The parsonage-house is a neat commodious building. Near this place is a pond which covers near 200 acres of ground, but was formerly much larger, as it reached the bishop of Winchester's palace at Bishop's Sutton, a mile and a half distant. By charter from king John, the Itching was made navigable for barges and lighters; but the navigation has long reached no further than Winchester. The only manufactory is that of linseys. New Alresford is governed by a bailiff, and 8 burgesses, and formerly sent a member to parliament. At Tichburn Hall, a gift of 2d. in bread or money is given to every applicant on Lady-day. Market day, Thursday.

ALROA, or ALROE, a Danish island.

ALROE, a small island of Jutland, in the gulf of Horsens, belonging to the bailiwick of Achia. Long. 10°. 30'. E. lat. 55°. 52'.

ALRUKAK, in the *materia medica*, a word used by Avicenna, and others, for what was called by the Greeks leptos libanotis, and manna thuris, i. e. the fragments of frankincense, broken off from the larger pieces in collecting or packing them.

ALRUM, in the botanical writings of the ancients, a name given to the tree which produces the bdelium. This gum was originally known to be the exudation of a tree growing in Arabia and the East Indies, and well known to Avicenna, and others, and by all of them called by that name.

ALRUNES, a name given by the ancient Germans to small figures of wood, of which they made their lares.

ALSA, in ancient geography, a river of Carniola, now the Ausa; running by Aquileia, with a short course from north to south into the Adriatic; where Constantine, the son of Constantine the Great, fighting against Constans his brother, lost his life.

ALSACE, LOWER and UPPER, a ci-devant province of France, now included in the departments of the Lower and Upper Rhine. It is bounded on the east by the Rhine; on the south by Switzerland; on the west by Lorrain; and on the north by the palatinate of the Rhine, or ci-devant department of Tonnere. It was formerly a part of Germany, but was given to France by the treaty of Munster. It is one of the most fruitful and plentiful provinces of Europe, abounding in corn, wine, wood, flax, tobacco, pulse, fruits, &c. Upper Alsace con-

VOL. I.

tains silver, copper, and lead mines; and is remarkable for the wine called strok, or straw wine. The mountains which divide it from Lorrain are very high, and generally covered with fir, beech, oak, and horn-beam. There are also iron-works in several parts of Alsace, and a mineral spring at Sulzbach, near Munster, which is in reputation for curing the palsy, &c. Of the two modern divisions of Alsace, (the Upper and Lower Rhine) Strasburgh and Colmar are the capital towns.

ALSADAF, in the *materia medica*, a name given by Avicenna and Serapio to the *unguis adoratus*; as also to the murex, or purple-fish, of the shell of which it was supposed to be a part.

ALSAHARATICA, in botany, used by some to signify the *parthenium* or *feverfew*.

ALSAHARCUR, in the *materia medica*, a name given by Rhases, and some others of the old writers, to the skink, a small animal of the lizard kind, used in medicine as a cordial, and as a provocative to venery.

AL SEGNO, in music, to the sign, an expression used to avoid writing the same passage twice over, and generally placed at the end of rondeaux, and such vocal compositions as are constructed upon the principle of the grand coup Ternaire: the first part or division of which must always be repeated. The sign to which the return is made is generally marked thus,

ALSEN, a fertile island of Denmark, about 100 miles west of Copenhagen, in the entrance to the Baltic, between Sleswick and Funen, and belonging to the duchy of Sleswick. It is remarkable for two castles, and produces large crops of grain, and aniseeds, a carminative much used in seasoning the food and bread all over the Danish dominions. Alsen is about eighteen miles long and nine broad, or 132 square miles in superficial extent; and contains 15,045 inhabitants. The chief town is Sonderburg.

ALSFELD, a town of Germany, in the grand duchy of Hesse, 18 miles east of Marburg, and 50 north-east of Frankfort. It is an ancient town, and well built; and the inhabitants were the first of this country who embraced the Reformation. Lon. 9°. 5'. E. lat. 50°. 45'. N. Inhabitants 3000.

ALSHASH, a province containing formerly a very beautiful city in Bukharia, supposed to be the same with that called Tashcant, the capital of the eastern part of Turkestan. It was situated on the river Sihûn, now Sir, and had a well watered garden for every house; but was ruined by Jenghiz Khan.

ALSHEDA, a parish of Sweden, in the province of Smaland, containing a gold mine: discovered in 1738.

ALSHEIM, a market town of the grand duchy of Hesse, formerly in the upper bailiwick of Alzey, containing 165 houses, and 1030 inhabitants. It is 10 miles north of Worms.

ALSIMBEL, or SIMBALETH, in the *materia medica*, a name given by Avicenna and others to the spikenard of India; so called from its

having the appearance of a spike, or ear, or a congeries of many spikes, or ears, as the nardyx Indica, or Indian spikenard.

ALSINA, in botany, a synonyme of the theligonum. See THELIGONUM.

ALSINASTRUM, in botany, the trivial name, and also a synonyme of the elatine. See ELATINE.

ALSINE, or CHICKWEED, a genus of the trigynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 22d order, caryophylleæ. The characters are: CAL. quinquephyllous; COR. five equal petals, longer than the calyx; STAM. five capillary filaments; the antheræ roundish; PIST. an oval germen, three siliform styli, and obtuse stigmata; PER. an ovate unilocular capsule, with three valves: the seeds are roundish and numerous. Of this genus a great number of species are enumerated by some botanical writers; but none of them possess any remarkable properties, except the A. media, or common chickweed, with white blossoms, which affords a notable instance of what is called the sleep of plants. Every night the leaves approach in pairs, so as to include within their upper surfaces the tender rudiments of the new shoots; and the uppermost pair but one at the end of the stalk are furnished with longer leaf-stalks than the others; so that they can close upon the terminating pair, and protect the end of the branch. The young shoots and leaves, when boiled, are hardly to be distinguished from spring spinach.

ALSINEFORMIS, in botany, the montia fontana, of Linnaeus.

ALSINELLA, in botany, the name by which Dillenius calls the plant sagina.

ALSINGSUND, a strait in the Baltic, near Sunderburg, which separates the island of Alsøn from the main land of Sleswick. It is about 30 miles in length, but not above three in breadth, in many places.

ALSIROIDES, the bafonia and montia of Linnaeus.

ALSI RAT, in the Mahomedan theology, a bridge over the middle of hell, said to be finer than a hair, and sharper than the edge of a sword, over which people are to pass, after their trial, on the day of judgment. Mahomet assures us, that the alsirat, narrow as it is, is beset with briars and thorns; none of which, however, will be any impediment to the good, who shall fly over it like the wind, Mahomet and his followers leading the way; wherea the wicked, by the narrowness of the path, th entangling of the thorns, and the extinction of the light, which shall direct the former to paradise, will miss their footing, and fall into perdition.

ALSIUM, a city of ancient Etruria, occupying the spot on which Pala now stands. Dionysius Halicarnassensis says, that Alsjum was built by the Aborigines, long before the Tyrrhenians invaded Italy. In this case it must have been founded not long after the dispersion in the days of Peleg. Its founder is said to have been one Alasus, or Alisa; whom some conjecture to have been Alisah, or Elisha, the son of Javan, mentioned in scripture.

ALSITZ. See ALISONTIA.

ALS'O, *adv.* { Gothic *als*, all, so or so, the AIs. } article this or that.

pe cyte he barnde al clene & a chyrche also
Of oure leuende pat per innē was. R. Gloucester

Sad remembrance now the prince amoves,

With fresh desire his voyage to pursue;

Als Una earn'd her travel to renew. Faerie Queene.

In these two, no doubt, are contained the causes of the great deluge; as according to Moses, so also according to necessity: for our world affords no other treasures of water. Burnet's Theory.

ALSOP (Vincent), a non-conformist minister, a native of Northamptonshire, and educated at St. John's College, Cambridge. He was successively minister of Welby, in his native county, (whence he was ejected in 1662,) and pastor of a dissenting church in Westminster. King James II. shewed him the great favour of pardoning his son when he had been convicted of treason. He died in 1703; and wrote,— 1. Antisozzo, against Dr. Sherlock, 1675. 2. Melius Inquicendum, in an answer to Dr. Goodman's Compassionate Inquiry, 8vo. 1679. 3. The Mischief of Impositions, in answer to Stillingfleet's Mischief of Separation, 1685. 4. Duty and Interest united in Praise and Prayer for Kings. 5. Practical Godliness the ornament of Religion, 1696.

ALSOP (Anthony), a divine and poet, educated at Westminster school, and at Christ Church, Oxford; where he took the degree of M.A. in 1696, and B. D. in 1706. He published Fabularum Æsopicarum Delectus, Oxon, 1698, 8vo., with a poetical dedication to lord viscount Scudamore, and a preface in which he took part against Dr. Bentley in the famous dispute with Mr. Boyle. He passed through the usual offices in his college with considerable reputation, until his merit recommended him to Sir Jonathan Trelawney, bishop of Winchester, who appointed him his chaplain, and soon after gave him a prebend in his cathedral, together with the rectory of Brightwell, Berks. In 1717, a verdict for a breach of promise of marriage being obtained against him for £2000., he retired for some time abroad. His death, which happened June 10th, 1726, was occasioned by his falling into a ditch near his garden door. Besides the Fabularum Æsopicarum Delectus, a book of his poems, entitled Antonii Alsopi, Edis Christi olim alumni, Odarum Libri duo, and several pieces in Doddsley's collection remain. Bentley calls him Tony Alsop, a late editor of the Æsopian Fables.

ALSOPIHILA, in botany, from $\alpha\lambda\sigma\omega$, a grove, or forest, and $\phi\lambda\tau\omega$, to love; alluding to the favourite station of this beautiful tribe of tree ferns.—Brown Prodr. Nov. Holl. v. 1, 158. This genus is founded on our Cyathea aspera, C. extensa of Swartz, Polypodium lunulatum of Forster, and some other allied species, and can scarcely be distinguished from the first of these.

ALSO-SAJO, a place in Hungary, in the county of Gomah, where great quantities of cinnabar, and some mines of quicksilver, are found.

ALSTEDIUS, (John Henry), a protestant divine, and one of the most indefatigable writers of the seventeenth century. He was professor of philosophy and divinity at Herborn, in the county of Nassau; whence he removed into

Transylvania, to be professor at Alba Julia, and continued there until his death, in 1638. He wrote, 1. An Encyclopædia. 2. Triumphus Bibliorum Sacrorum, seu Encyclopædia Biblica, 12mo. 1620; and united, with his laborious pursuits as an Encyclopædist, some sanguine and peculiar views of prophecy. See his *De Mille Annis*, in which he anticipated that the millennium would begin in 1694.

ALSTON, (Charles), an eminent physician and botanist, was born in Scotland in 1683, and educated at Glasgow, from whence he went to Leyden, and took his doctor's degree. On his return he settled at Edinburgh, and became lecturer on the *materia medica* and botany. He died in 1760, having published *Tirocinium Botanicum Edinburgense*, in which he attacked the sexual system of Linnaeus. His lectures on the *Materia Medica* were published in two vols. 4to. 1770. He wrote also some papers in the Edinburgh Medical Essays.

ALSTOMIA, in botany, called also *symplocos*, a genus of the monogynia order, belonging to the hexandria class of plants; so named after the above botanist. The characters are: CAL. a perianthium beneath, imbricated: COR. monopetalous, and shorter than the calyx; the border expanding, eight or ten parted, with alternate divisions: STAM. numerous short filaments, the exterior ones longer; the anthers are orbicular and furrowed: PIST. a small ovate germin above; a simple stylus the length of the corolla, filiform and erect; the stigma inverse, egg-headed. There is but one species, viz. *A. theaformis*, a native of America. Mr. Brown has given this name to another plant, of the class and order pentandria monogynia, of which he describes four species in his *Trans. Werner.* Soc. vol. i.

ALSTON-MORE, or ALSTON MOOR. See ALDSTON MOOR.

ALSTROEMER (Jonas), a patriotic Swedish manufacturer, was born of poor parents at Alingsas, in West Gothland, in 1685. He visited London while in very indigent circumstances; and paid such particular attention to its trade, and the manufactures of Great Britain, that, on his return home, he soon raised his native town to a flourishing condition, and kindled a spirit of emulation which diffused itself all over Sweden. Alstroemer followed up this good work by collecting information respecting manufactures from all parts of Europe; and carried on, at the same time, a most extensive sugar-house at Gottenburgh, and traded to the Indies and the Levant. He is said to have introduced many useful plants, particularly the potatoe, into Sweden. He also improved the woollen trade, by importing sheep from England and Spain, and the Angora goat. Alstroemer, in the decline of life, was deservedly honoured with letters of nobility, the order of the polar star, and the title of counsellor of commerce. The academy of sciences chose him a member, and the national states decreed a public statue to be erected to his honour on the exchange of Stockholm. He died in 1761, leaving a large fortune to his four sons, three of whom were also men of talents and considerable public importance.

ALSTROEMER (Claude), born in 1736, became

a pupil of Linnæus. He travelled over a great part of Europe, in the course of which he sent many valuable plants to his preceptor, and, among the rest, the seeds of a fine Peruvian plant, to which Linnæus gave the name of the lily of Alstroemer. One of his papers on the simia mammon is in the memoirs of the academy of Stockholm. He died in 1794.

ALSTROMERIA, in botany, a genus of the monogynia order, belonging to the hexandria class of plants; and, in the natural method, ranking under the eleventh order, sarmentaceæ. The characters are: There is no calyx: the corolla is nearly bilabiated; and consists of six petals, the two inferior tubular at the base: the stamens consist of six subulate filaments, declining and unequal; the antheræ oblong: the pistillum has an hexangular germin beneath; the stylus declining, filiform, the length of the stamens; and three oblong bifid stigmata: the pericarpium is a roundish hexangular capsule, with three cells and three valves: the seeds are globular and numerous. There are five species, natives of Italy and Peru.

ALSVIG, one of the Hebrides, near the isle of Sky.

ALT, a river in Lancashire, which runs into the Irish Channel, north of Liverpool.

ALT, or AFTWA, a river in Transylvania, whose banks and sands contain particles of gold.

ALT, from altus, high, Lat., in music, a term applied to the high notes in the scale.

ALTA GRACIA, a city of South America, the capital of the province of Satagaos, in the kingdom of Granada. It was founded in 1540, but has at present a scanty population.—Also a town in the government of Buenos Ayres, and province of Cordova, twenty miles south-south-west of Cordova. This is the name likewise of five settlements, three of which are in Guiana and in the province of Cumana; one in the kingdom of Peru, and government of Tucuman; and the other in the province and government of Venezuela.

ALTAIEST, in chemistry. See ALKAHEST.

ALTAIC CHAIN, or ALTAIC MOUNTAINS, a range of mountains in Asia, extending, under different names, about 5000 miles in length, between the 70th and 140th degrees of east longitude. The compact of this immense chain consists, for the most part, of granite, porphyry, limestone, marble, and various valuable ores. In some parts of it, in Russia, are several gold and silver mines; and large masses of native iron have been occasionally obtained. This range gives rise to many of the largest rivers of northern Asia, and several lower ridges diverge from it, and diversify the neighbouring districts. Little, however, is known beyond its outlines and general direction. The Bogdo Tola, or Bogdo Alim, the Almighty mountain, is situated in about 94°. E. lon. and 47°. N. lat. on the limit between the Soongarian and Mongolian deserts: thence a chain runs north-west, called the Golden Mountain, being the main Altaian ridge, and passing the sources of the Irtish, extends to the lake of Altyn. Another range called Changai, passes to the south, and a ridge, by the Tartars called Alla Koola, or Alla Tau, or the

Chequered mountain, stretches to the west, and gives rise to the river Hi, a considerable stream running northward. This principal chain forms the boundary line between Russia and Independent Tartary, and proceeding onward from the Irtish to the Amur, or Amour river, branches into the mountains of Kamtschatka and Oudskoi, or Okhotsz, terminating in the sea of Kamtschatka, where it forms the extended chain of the Aleutian Islands, uniting the eastern shores of Asia with North-west America. The Lesser Altain chain separates Soongoria from the government of Koilyvan; and near the conjunction of these two main divisions are the principal sources of the Yenisei, the Oby, and the Irtish, which empty themselves into the Northern ocean. Though such of these mountains as have been explored present many interesting mineralogical and geological facts, and the whole chain, in point of magnitude and extent, can be rivalled only by the Andes of South America, they have never been very accurately laid down in maps, and are known amongst the semi-barbarous people who inhabit the surrounding country, by so many various names and subdivisions, that a connected description of them is exceedingly difficult to gather. That part of the chain immediately south of the lake Baikal is said to be upwards of 10,000 feet in altitude. The Russian maps of these districts are little credited by Major Rennell; and though they are preferred by Mr. Pinkerton, it is admitted that these mountains are very faintly described in them. The map of Isleniff, a Russian officer, appears to be the best.

The part of this chain best known is the nine Russian portions, which are divided into the Alasey or Alaskai, the Kolhyvan, the Korbolikinsk, the Oubinsk, the Buktarmiinsk, the Teletsk, the Tsharinsk, the Krasnoyarsk, and the Kunetz. The last two ridges are almost wholly inaccessible, and the tops of many of them are covered with perpetual snow, and sometimes the seven preceding divisions are called the Kolhyvan mountains, as situated principally in the government of that name. The best mines of Siberia are found in these mountains, particularly in the Korbolikinsk division. In the course of forty years of the last century, the only period of which any regular account of the annual produce of these mines appears to have been kept, they produced 830 poods Russian (equal to about thirty-six English pounds each) of fine gold; and 24,460 poods of fine silver. The copper mines yield annually 15,000 poods of metal; the iron mines, running through the larger portion of the range, are too extensive, and in the hands of too many agents, to be distinctly estimated; but they form one of the most important sources of the rising greatness of the Russian empire.

ALTAR, in astronomy, a star of the first magnitude, in the constellation Aquila.

ALTAMIRA, a small town and county of Galicia, Spain, fifteen miles west of St. Jago de Campostella.

ALTAMURA, a town of Naples, in the territory of Bari, with the title of a principality, and the seat of a royal governor, at the foot of the Appennine mountains. It contains 16,000 inhabitants, many of whom are Greeks, and is six

miles north-east of Gravina. Some have supposed this to be the ancient Petillia.

ALTAR, n. Latin *altare*, (quasi alta ara the rising altar on which the victims were burnt [the ara being a less elevated spot, where prayer and drink offerings were presented.] A place raised to receive offerings to Jehovah in the Jewish theology, and to the gods in the heathen mythology. Also a term used by some Christians to designate the place where the Lord's Supper is dispensed.

*þe kyng wepte with his inc, that sight mykelle he praised,
& siluer grete plente vpon the altere laid.*

R. Brunne, p. 79.

Men of Athenys, bi alle thingis I se ghou as veyno worschiperis, for I passide and segh ghoure mawmetis, and foonde an *auter* in which was written to the unknown God; therefore which thing, ghe unknowinge worschiperis, this thing I schewe to ghou.

Wyclif, *Dedis.* ch. xvii.

Her grace rose; and, with modest paces,
Came to the *altar*; where she kneel'd, and saint-like
Cast her fair eyes to heav'n, and pray'd devoutly.

Shakespeare.

The way coming into our great churches was anciently at the west-door, that men might see the *altar* and all the church before them; the other doors were but posterns.

Thy liberal heart, thy judging eye,
The flower unheeded shall deserv,
And bid it round heaven's *altars* shed
The fragrance of its blushing head.

Gray's *Ode for Music.*

Before thy mystic *altar*, heavenly Truth,
I kneel in manhood, as I knelt in youth,
Thus let me kneel, 'till this dull form decay
And life's last shade be brighten'd by thy ray
Then shall my soul, now lost in clouds below,
Soar without bound, without consuming glow.

Sir W. Jones.

ALTAR, the Lexicography of which is already given, properly signifies a table, or a raised place on which any offering was made. It is so called, because altars were set up by the Heathens in high places, or, at any rate, raised above the ground. Indeed the opinion has prevailed, that the word altar in its early acceptation denoted nothing more than the spot on which sacrifices were made. Hesychius and Phavorinus expressly speak of people who had sacrifices without altars, (or distinct edifices.) Strabo makes a similar assertion respecting the ancient Persians. The history of these celebrated monuments connects itself with one of the most important enquiries of the human mind, viz. the origin of sacrifices, from their connection with which it is inferred, that the date of their first appearance is almost coeval with that of the world. Gen. c. iv. Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some remove them as far back as Adam, whose altar is much spoken of by Jewish and even Christian writers. Others are contented to make the patriarch Enoch the first who consecrated a public altar. Be this as it will, the earliest altars of which we find an express testimony are those of Noah, Gen. viii. 20, and of Abraham, Gen. xii. 7, In the patriarchal times altars were, no doubt, of rude construction, and temporary, appro-

priated to the occasion for which they were immediately designed. The altar which Jacob set up at Bethel was merely the stone on which he rested, Gen. xx. 8.; such was also the altar of Gideon, Judges, vi.; and the first altar which Moses erected was made of earth, by the command of God, Exod. xx. 24. Among the Jews, the principal altars were the altar of incense, the altar of burnt-offerings, and the altar or table of shew-bread. These were built of wood, the first and the last were overlaid with pure gold, and the second with brass, but all richly sculptured by the hands of cunning workmen, and enriched with the choicest beauties of Jewish architecture. In this, the Jews, for the times in which they lived, were not inferior to any people; and though our information on these particulars is comparatively scanty, yet the admirable skill with which their temple was contrived and beautified, imposes a magnificent idea of the embellishment attached to their altars. The form of these erections has been a subject of considerable alteration amongst the learned; and accordingly different opinions have been given. They are represented by Josephus as being square, and having horns at the four corners. His words are *τετραγωνος δ' ἀρυντο, κέρατοις προσανεχών γωνιας.* We find an allusion to such appendages in many parts of scripture; but whether these horns were made of wood, or were in reality the horns of some animal is not obvious. Whether they were merely ornamental appendages, or answered some practical purposes, has also been questioned. Some writers have imagined, that they served to move, and carry the altar with the greater ease and steadiness. Michaelis doubted whether they were real projections, and averred that nothing more was intended by the horns than the four corners of the edifice. 'Those who have thought otherwise,' says a late writer, 'have not informed us whether they were upright, oblique, or curved.' Spencer, Le Clerc, Witsius, and others, considered them horn-shaped, like the *ara pacis* of the Romans; various theories have been entertained. They have been thought emblematical of dignity and power, and to refer to the diverging rays of the solar orb when breaking forth in the morning or from behind a cloud, especially as the word translated horn, also signifies a ray of light. There can be no doubt that they were real appendages; and their uses, with respect to the larger altar, are sufficiently obvious. They served to secure the sacrificial victims, see Ps. cxviii. 27; and for fugitives to seize, when fleeing to that monument for protection.

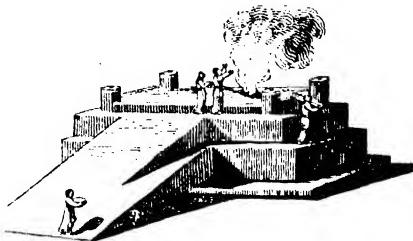

The altar of incense was made of shittim wood, adorned after the manner already described. It was one cubit square, and two cubits high, with an ornament of gold like a carved moulding round the top of it; it was carried about by two bars of the same wood, overlaid with gold, and passing through four golden rings. Its use was for burning incense morning and evening. It was particularly to be sprinkled with the blood of the sacrifices that were offered for the sins of ignorance, committed by particular persons, or by the community in general. The following diagram, will perhaps,

sufficiently illustrate its appearance to the understanding of the curious reader, in which are to be observed:—

1. The horns;
2. the crown of pure gold;
3. the rings under the crown;
4. the censer which was placed upon it. See Exod. xxx. 1. &c. This celebrated altar was hidden before the captivity, by the prophet Jeremiah. See 2 Maccab. ii. 5. &c.

The altar of burnt-offering, described Exodus xxvii. and xxviii., was made of shittim wood, overlaid with brass, and had four brass rings, through which were put two bars, by which it was carried on the shoulders of the priests. At each corner was a horn or spire, wrought out of the same wood with the altar, the uses of which have already been surmised. Within the hollow was a grate of brass, supposed to be about five feet square: on this the fire was made, and through it fell the ashes into an inferior receptacle. This part of the apparatus was suspended by rings at the corners, attached, possibly, to chains in the cavity of the altar. The dimensions of this altar were five cubits, or two yards and a half square; and three cubits, or a yard and a half high. It was placed towards the east end of the court, fronting the entrance of the tabernacle, and at such a distance that the smoke of the fire might not disfigure the furniture within the tabernacle. The altar made by Solomon, and mentioned 2 Chron. iv. 1, &c. was much larger than the former. We exhibit the following diagram, as an illustration of this edifice,

in which the reader will observe: 1. the horns, or four spires, at the four corners; 2. the grate of brass, in which the fire was made; 3. the pan which received the ashes; 4. the rings and chains by which it was affixed to the horns before alluded to; and 5. the *kibbesh*, or ascent to the altar, Exod. xx. 26, &c.; 2 Chron. iv. 1, &c. Between the grate and the altar sufficient space was left on every side to prevent the fire from damaging the wood work, and every thing was regulated with the utmost exactness. The fire on this altar was considered as sacred, having first descended upon it from heaven, Lev. ix. 44, and was therefore kept constantly burning, Lev. vi. 13. Hence, probably, the Chaldeans and Persians borrowed their notions of sacred fire,

ALTAR.

which was always preserved with great care and attention, and from them this custom is known to have passed to the Greeks and Romans. This altar was demolished by the Babylonians at the conflagration of the temple, but was restored immediately on the return of the Jews from captivity, Ezra iii. 3. It was now a large pile of unhewn stone, 32 cubits square at the bottom, and gradually decreasing to the top, or hearth, which was a square of 24 cubits, and one cubit high, made of solid brass, and hence called the brazen altar. The ascent to the altar was by a gentle rising on the south side, corresponding with the kibbesh in the diagram. This part of the structure was 32 cubits in length, and 16 in breadth, and banded on the upper benching-in next the hearth, or the top of the altar. *Irid. Con.* vol. i. p. 199.

The altar, or table, of shew-bread, was likewise of shittim-wood, overlaid with gold, and exquisitely adorned. Its dimensions were two cubits long, one wide, and one and a half high. It had a golden border, crown, or rim, round it, and upon it were placed two rows, including twelve loaves of bread, with salt and incense, which were changed every Sabbath-day. This table was also furnished wth, golden dishes, spoons, and bowls. The Jews gave the name of 'altars' to a kind of tables occasionally raised in the country or fields, on which sacrifices were offered; thus we often read, in such a place an altar was built to the Lord.

The altars of the Heathens were at first made of turf; afterwards of stone, marble, wood, and even of horn, as that of Apollo in Delos. Before temples were in use, altars, as already intimated, were erected in groves, in the highways, and on the tops of mountains; and it was customary to engrave upon them the name or attribute of the deity to whom they were consecrated. They were also of different kinds with regard to their qualities, the uses to which they were applied, and the objects to which they were appropriated; being sacred to gods, heroes, virtues, vices, diseases, &c.: we read also of inner and outer, stationary and portable, public and private altars. Again, they differed in their figure, which was round, square, or triangular. All of them were turned towards the east, and generally adorned with sculpture, basso-relievo, and inscriptions, expressing the gods to whom they were appropriated, or representing their distinguishing symbols. For a specimen of pagan altars, see Plate III. Misc. No. 1 represents an altar dedicated to Neptune, and exhibits a trident, and two dolphins, the attributes of this deity, on its sides. No. 2 is a four-square altar; and, as the inscription informs us, dedicated to the nymphs. No. 3 was erected to Bacchus, and exhibits a Bacchanal, with a thyrsis in his hand, with two other sides, it appeared triangular. Each side of No. 4, which was triangular, exhibited a genius, one of whom is seen carrying an oar upon his neck, which seems to indicate that it belonged to Neptune. No. 5, with the inscription, 'Ara Neptuni,' is of a round figure; the god is represented wholly naked, preserving the pallium on his shoulder, holding a trident in his left hand, and in his right a dolphin. Altars

differed also in their height as well as in their figure.

According to Servius, in Virg. Ecl. v. 66. Aen. ii. 515, those set apart for the honour of the celestial gods, or gods of the higher class, were placed on some pretty tall pile of building, as the altar of Olympian Jupiter, which was nearly 22 feet high; and for that reason were called altaria, from the words alta and ara, a high elevated altar. Those appointed for the terrestrial gods were laid on the surface of the earth, and called aræ—and, on the contrary, they dug into the earth, and opened a pit for those of the infernal gods, which they called βαθροι and λακκοι, scrobbiculi. But this distinction is not every where observed.

In the great temples of ancient Rome there were commonly three altars: the first placed in the sanctuary, at the foot of the statue of the divinity, upon which incense was burned, and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offering and the sacred vessels.

The Greeks had two species of altars: that whereon they sacrificed to the gods was called βωρος, and was a real altar, different from the other, whereon they sacrificed to the heroes, which was smaller, and called εσχαπα. Pollux makes this distinction of altars in his Onomasticon: but adds, that some poets used the word εσχαπα for the altar whereon sacrifice was offered to the gods. (The Septuagint version sometimes also uses εσχαπα for a sort of little low altar, which some authors express in Latin by craticula.) The nymphs, instead of altars, had αντρα, caves, in which adoration was paid to them.

The superior altars of the Greeks were ranged under three subdivisions: the εμπυρος, designed for burnt-sacrifices; ατηρος, without fire, and αναιματος, without blood; for upon the two last, only offerings of cakes, or fruits of the earth, and libations, could be presented to their respective divinities. Venus had an altar at Paphos, which was αναιματος, but not ατηρος; and Tacitus says that she was worshipped, precibus solis et igne puro, by prayers and fire alone. Among

primitive Greeks, the consecration of their altars was attended but with little expense; but as they increased in riches, they gradually introduced more magnificent and costly ceremonies into this part of their religious worship. From a passage in the Εργη of Aristophanes, and from the Danaides of that poet, we find that the ordinary mode of the consecration of altars was similar to that of images. He speaks of a woman dressed in a robe of various colours, with a vessel filled with pulse upon her head, consecrating the statues of Mercury and the altars of Jove. The usual mode of dedication was performed by placing a garland of flowers upon them, then anointing them with oil, and afterwards offering up libations of wine and oblations of fruits. There is no doubt but that the unction, with oil, constituted the principal part of the ceremony of consecration; and that this practice was derived from the most remote antiquity. We all know

that, among the Jews, the altar of Moses was consecrated by the pouring out of oil, by the express command of God, and that the altar of Jacob was dedicated by the performance of the same ceremony.

The altars of the ancient heathens, like those of the Jews, were adorned with horns, to which the victims were fastened, and to which criminals, who fled for refuge, used to cling. The ancients also, on solemn occasions, as in forming alliances, and confirming treaties of peace, swore upon them and by them. See Adam's Rom. Ant. p. 140, &c. In the Dionysica of Nonnus, Agave is introduced offering up a sacrifice upon εὐκεραν παρα βωμῷ. The same ornaments are still visible in those which remain in the ruins of Rome. Although we have given the most common forms of the altars of the ancients, other forms were common, and for the most part different forms appear to have been adopted by different nations. The square form was that most common among the Greeks; but we find, from ancient medals, that altars of the circular and pyramidal figures were not unfrequent. It is probable, that the custom which was observed, of placing the altars on the eastern side of their temples, suggested the Christian custom of placing the sacramental table on the eastern side of the early churches.

The altar which the apostle Paul found at Athens, bearing the inscription of the Αγνωτος Θεος, eternized by the memorable discourse of which it became the basis, has created considerable diversity, and even contrariety of opinion among biblical critics. The erection of this altar has been ascribed, by some, to Dionysius, the Areopagite; who, unable to account for the eclipse at our Lord's death, was yet sensible that it was the sympathy of nature with a superior being. Theophylact attributes it to the appearance of an unknown spectre after a battle lost by the Athenians: others to a complaint of the god Pan, during the war between the Persians and the Greeks, who, considering himself neglected, acted accordingly; whence, lest any other deity should have like cause of displeasure, an altar as erected intended to include all those gods who were not named in the general description. Lucian, in his Philopatris, swears by 'the unknown god of Athens.' Some have supposed the god of the Jews to be intended, whose name was unknown to them. Jerome supposes, that the inscription on this altar was not, as St. Paul quotes it, 'to the unknown god,' but 'to the gods of Asia and Europe and Africa, unknown and strange gods'; and that the apostle has not quoted the inscription exactly, but dexterously applied it to the occasion. Theophylact and Ecumenius are also of opinion, that the inscription was 'to gods,' in the plural number. But Chrysostom, and Isidore of Pelusium, assert, that the inscription was as St. Paul quotes it. Le Clerc says, that though the inscription was in the plural number, St. Paul was in the right to allege it in the singular. The notions of Diogenes Laertius, in Epimen. lib. i. seg. 110. p. 70, 71, are as follows: 'about 600 years before Christ, the fame of Epimenides was very great

among all the Greeks, and he was supposed to be in favour with the gods. The Athenians being afflicted with a pestilence, they were directed by the Pythian oracle to get their city purified by expiation. They therefore sent Nicias, son of Niceratus, in a ship to Crete, inviting Epimenides to come to them. He came accordingly, in the forty-sixth Olympiad, purified their city, and delivered them from the pestilence in this manner: taking several sheep, some black, others white, he led them up to the areopagus, and then let them go where they would; and gave orders to those who followed them, wherever any one of them should lie down, to sacrifice it to the god to whom it belonged; and so the plague ceased. Hence it comes to pass, that to this present time may be found, in the boroughs of the Athenians, anonymous altars, a memorial of the expiation then made.'

ALTAR of Adam, in antiquity, is pretended by some rabbins and others to have been erected by the first man posterior to the fall; when, being overwhelmed with sorrow, the promise was made him by the ministry of the angel Haniel, of a redeemer. In gratitude he is said to have built an altar, and sacrificed. The reliques of this monument have been mentioned by several writers of later ages.

ALTAR, in modern times, is used for a square table placed on the eastern side of the church, raised a little above the floor, and set apart for the celebration of the sacrament. Its form is not borrowed either from that of the heathen altars, or even from that of the Jews in the temple; but from the view taken of the eucharist as a supper. Its name is the communion table; the denomination, altar, is founded on the supposition, that the eucharist is a proper sacrifice; which, though the standing doctrine of the church of Rome, is utterly denied by most of the reformed churches. Accordingly, bishop Ridley, in the reign of Edward VI. A.D. 1550, issued injunctions for taking down all altars, and requiring the churchwardens of every parish to provide a table, decently covered, and to place it in such a part of the choir or chancel as should be most meet, so that the ministers and communicants should be separated from the rest of the people. The canons of the council of Nice, as well as the fathers St. Chrysostom and St. Augustin, call it the Lord's table; and though they sometimes call it an altar, it is to be understood figuratively. An altar has relation to a sacrifice; so that if we retain the one, we must admit the other. The practice of consecrating altars with their furniture was introduced

indicated by archbishop Laud, in the reign of Charles I., but objected to by Prynne, as having no higher original than the Roman missal and pontifical edicts. To the antiquity of altars it was replied, that though the name is often mentioned in Scripture, yet it is never applied to the Lord's table; but altars and priests are put in opposition to the Lord's table, and ministers of the New Testament, 1 Cor. ix. 13, 14. It was added, that it cannot be pretended, by any law or canon of the church of England, that it is called an altar more than once, stat. 1 Edward

VI. cap. 1., which statute was repealed within three years, and another made in which the word altar is changed into table.

ALTAR of Prothesis, is a name given by the modern Greeks to a smaller preparatory kind of altar, wherein they bless the bread, before it is carried to the large altar where the liturgy is performed. F. Goar maintains that the table of prothesis was anciently in the sacristy or vestry; which he makes appear from some Greek copies, where sacristy is made use of in lieu of prothesis.

ALTAR, in church history, is also used for the oblations or contingent incomes of the church. In ancient days they distinguished between the church and the altar. The tithes, and other settled revenues, were called the church, ecclesia; and other incidental incomes, the altar.

ALTAR, in astronomy. See ARA.

ALTARAGE, in law, altars erected in virtue of donations, before the reformation, within a parochial church, for the purpose of singing of mass for deceased friends.

ALTARIST, **ALTARISTA**, or **ALTARTHAN**, properly denotes the vicar of a church who serves the altar, and to whom the alterage, or produce of the altar, is assigned for his maintenance. The altarist is likewise called **altararius**, and sometimes **altar priest**. It is also used for chaplain.

ALTAR-THANE, or **ALTARIST**. See ALTARIST.

ALTASRIF, in literary history, the title of a medicinal book written in Arabic, describing the medical practice in use among the Arabs. It was written by Alsaharavius, and translated into Latin by P. Ricius in 1519.

ALTA TENURA, in law, the high tenure in chief, or by military service.

ALTAVELA, in ichthyology, the name of a flat cartilaginous fish, of the aquila marina kind; but with its wings, as they are called, that is, its thin and flat sides, broad and obtuse towards their lower part. The fishermen, from the resemblance these flat sides have to wings, have an opinion that this fish can fly. The tail is very short, being scarce half the length of the body. Its flesh is solid, and well tasted, and it sells well in the markets. It abounds in the Mediterranean.

ALTAVELIA, in geography, a town of Italy, in the kingdom of Naples, and province of Principato Ultra, seven miles south of Benevento.

ALTAVILLA, a town and county of Naples, in the Principato Citra, eighteen miles south-east of Salerno.

ALTDORF, or **ALTOFF**, a handsome town of Switzerland, chief of the canton of Uri. It is situated below the lake of the four cantons, in a plain, at the foot of a mountain, whose passages are difficult, and serve instead of fortifications. It is celebrated for being the place where William Tell shot the apple from his son's head.—See **TELL** (William.) The town-house and the arsenal are worth seeing.

ALTE et RASSE, in middle age writers, sovereignty, or a thing done with supreme power.

ALTEA, a sea-port town of Valencia, in Spain, on the coast of the Mediterranean. It

was taken in 1706 in favour of the archduke Charles; but lost after the battle of Almanza, in 1707. It is twenty-four miles north-east of Alicant.

ALTENA, or **ALTONA**. See ALTONA.

ALTENA, a manufacturing town in the Prussian grand duchy of the Lower Rhine, formerly included in the Westphalian county of Mark. It is seated on the Lenne and Nette, and has a Lutheran and Calvinist church, a court of justice, 590 good houses, and about 3300 inhabitants. Thirty miles north-east of Cologne. Also, a small district of South Holland, between the Maese and Biesbosch.

ALTENBERG, a lordship and flourishing town of Germany, in the Saxe Gotha portion of the old principality of Altenburg, Upper Saxony. Of that principality, this was the capital. At present it has excellent manufactures of cotton and wool; and a good trade in corn and cattle. Population about 9500. This is also the name of a mining town in the Erzgebirg, or miners' portion of Saxony. Eighteen miles south of Dresden.

ALTENBURG, or **OLDENBURG**, an ancient town of Germany, in the duchy of Holstein.

ALTENHOFEN, a market town in Carinthia, on the small river Metnitz, with a castle. There are iron-works in the neighbourhood. Four miles north-east of Veitshöchheim.

ALTENKIRCHEN a small town of Germany, in the Westerwald, which was the scene of several obstinate conflicts between the French and Austrians, in 1796. Fifteen miles north-north-east of Coblenz. Long. 7°. 29'. E. lat. 50°. 38'. N. Also a market-town of Pomerania, in the land of Wittow, situated near the point of the peninsula.

ALTENMARKT, or **ALTENWICHT**, a market town in Upper Bavaria, circle of the Iser, district of Obing, on the borders of Saltzburg, twenty-six miles north-west of Saltzburg.

ALTENMARKT, two market towns in the Austrian dominions; one near the Enns, in the circle of Bruck, Styria, fourteen miles north-east of Rottenmann; the other in the quarter above the forest of Vienna, Lower Austria, four miles south-west of Baden.

ALTEN-OETINGEN, a market town in Upper Bavaria, with 1400 inhabitants.

ALTENSTADT, a market town and bailiwick in the grand duchy of Hesse.

ALTER , <i>v.</i> ALTERABLE , ALTERANT , ALTERATE , ALTERATION , ALTERATIVE , <i>n & adj.</i>	} Alter, vel <i>alterage</i> , } other. To make other- } wise or different; to } change.
--	---

And whether the body be *alterant* or altered, evermore a perception precedeth operation; for else all bodies would be alike one to another. *Bacon.*

Why may we not presume, that God doth even call for such change or *alteration*, as the very condition of things themselves doth make necessary? *Hooker.*

Alteration, though it be from worse to better, hath in it inconveniences, and those weighty. *Id.*

Do you note,
How much her grace is *alter'd* on the sudden?

How long her face is drawn? how pale she looks,
And of an earthly cold?

Shakespeare's Henry VIII.

Acts appropriated to the worship of God by his own appointment, must continue so, till himself hath otherwise declared; for who dares alter what God hath appointed.

Stillingfleet.

That *alterable* respects are realities in nature, will never be admitted by a considerate discerner.

Glanville.

Our condition in this world is mutable and uncertain, *alterable* by a thousand accidents, which we can neither foresee nor prevent.

Rogers.

Medicines called *alterative*, are such as have no immediate sensible operation, but gradually gain upon the constitution by changing the humours from a state of distemperature to health. They are opposed to *evacuants*.

Quincy.

When there is an eruption of humour in any part, it is not cured merely by outward applications, but by such *alterative* medicines as purify the blood.

Government of the Tongue.

ALTER (Francis Charles), a critic of Germany, was Jesuit and laborious Greek teacher in the school of St. Anne at Vienna, was born at Englesberg in Silesia, in 1769, and died in 1804. He was the author, it is said, of 250 volumes and dissertations, the principal of which, *Novum Testamentum ad codicem Vindobonensem Graecè expressum*, two volumes 8vo, has been critically examined by bishop Marsh, in his preface to Michaelis. Among his other works, are a German Translation of Harwood's Classics, 8vo. Vienna, 1778: *Lysias*; *Ciceronis Quaest. Acad. Tusc.*; *Lucretius*; Homer's Iliad, with various readings from the MSS. in the Imperial Library; and Homer's Odyssey, &c. with various readings from the Palatine library, 8vo. 1785-94.—2. Some of Plato's Dialogues, 8vo. 1784. 3. Thucydides, 8vo. 1785. 4. The Greek Chronicle of George Phranza, or Phranzes, not before printed: Vienna, fol. 1796, &c. 5. Notices, in German, of the Literary History of Georgia.

ALTERANTS, or alterative medicines, such as correct the bad qualities of the blood, and other humours, without occasioning any sensible evacuation.

ALTERATION, in alchemy, denotes the conversion of one body into another by similitude.

ALTERATION OF QUANTITIES, amongst algebraists, denotes what we otherwise call variations, or permutations.

ALTERCATION, n. Lat. *Altercatio*, from alter. The alternate expression of difference of opinion between two persons, in which the debate is somewhat acrimoniously conducted.

þe parties wer so felle *altercand* on ilk side,
þat non þe soth couch telle, whedir pes or were
suld tide,
Bot God þat is of myght, and may help whan he
wille.

R. Brunne, p. 314.

By this hot pursuit of lower controversies amongst men professing religion, and agreeing in the principal foundations thereof, they conceive hope, that, about the higher principles themselves, time will cause alteration to grow.

Hooker.

Their whole life was little else than a perpetual wrangling and *altercation*; and that, many times, rather for victory and ostentation of wit, than a sober and serious search of truth.

Hakewill on Providence.

ALTERCUM, in botany, a name for the *hyoscyamus*, or henbane.

ALTERNANTHERA, in botany, so called from the stamens being, as it was thought, alternately furnished with anthers, and without them.—Forsk. *Ægypt. Arab.* 28. Brown Prodri. Nov. Holl. v. i. 416.—Class and order, Pentandria Monogynia. Natural Order, Iloleraceæ, Linnaeus. Amaranthi, Jussieu. Its General Characters are: CAL. perianth inferior, of one leaf, in five deep, coloured, pointed, spreading, permanent, and finally hardened, segments: COR. none: STAM. filaments five, capillary, shorter than the calyx, inserted into a membranous ring, round the base of the germen, with intermediate teeth; anthers simple, oval, of one cell, generally wanting one, two, or three of the filaments alternately: PIST. germen ovate, acute; style very short; stigma capitate: PERIC. capsule membranous, inversely kidney-shaped, compressed, of one valve and one cell, inflated, not bursting, enclosed in the cartilaginous calyx: SEED solitary, roundish, pointed. Essential Characters: CAL. in five deep segments, cartilaginous: COR. none: STAM. partly imperfect, inserted into a membranous ring, with intermediate teeth: anthers single-celled: SIG. capitate: capsule kidney-shaped, one cell, without valves: SEED solitary. The species are: 1. A. sessilis, sessile-flowered alternanthera. 2. A. denticula, or toothed A. 3. A. nodiora, or knotty-flowered. 4. A. angustifolia, or narrow-leaved. 5. A. nana, or dwarf. 6. A. achyrantha, in the Kew garden, where is also, 7. A. polygooides, or pericaria leaved A.

ALTERNATE, v. n. & adj.

ALTERN',
ALTER'NALLY,
ALTER'NATELY,
ALTERNA'TION,
ALTERNA'TION, n. & adj.
ALTER'NATIVELY,
ALTERNI'TY.

Alternatus,
from *alter* other.
To follow another in turn; to act in succession, after an interval filled up by another; to change regularly; to vary according to a prescribed rule.

That iche of thame by coursis *alternat*
Sa of gais and returnis that gait.

Douglas, b. vi. p. 167.

And God made two great lights, great for their use
To man; the greater to have rule by day,
The less by night, *altern.*

Milton.

The princess Melesinda, bath'd in tears,
And toss'd *alternately* with hopes and fears,
Would learn from you the fortunes of her lord.

Dryden.

Unhappy man? whom sorrow thus and rage
To different ills *alternately* engage.

Prior.

The rays of light are, by some cause or other, *alternately* disposed to be reflected or refracted for many vicissitudes.

Newton.

Friendship consists properly in mutual offices, and a generous strife in *alternate* acts of kindness.

South.

Hear how Timotheus' various lays surprise,
And bid alternate passions fall and rise!
While, at each change, the son of Lybian Jove
Now burns with glory, and then melts with love.

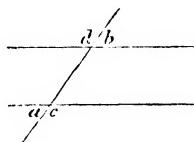

Pope.

Alternately transported and alarm'd!
What can preserve my life, or what destroy.

Young.

ALTERNATE, in heraldry, is used in respect to the situation of the quarters. Thus the first and fourth quarters, and the second and third, are usually of the same nature, and are called alternate quarters.

ALTERNATE ANGLES, in geometry, are the internal angles made by a line cutting two parallels, and lying on the opposite sides of the cutting line; the one below the first parallel, and the other above the second: thus,

in which *a* and *b*, *c* and *d*, are alternate angles, and respectively, equal to each other.

ALTERNATE LEAVES, in botany, when the leaves or branches of plants arise higher on opposite sides alternately.

ALTERNATE RATIO OR PROPORTION, is where the antecedent of one ratio is to its consequent as the antecedent of another to its consequent; the very same ratio, in this case holding alternately in respect of the antecedents of each other, and the consequents to each other. Thus, if $A : B :: C : D$; then, alternately, $A : C :: B : D$.

ALTERNATION in numbers, is used to express the different changes, or alterations of orders, in any number of things proposed. This is also called permutation, &c., and is easily found by a continual multiplication of all the numbers, beginning at unity. Thus, if it be required to know how many changes or alternations can be rung on six bells, multiply the numbers 1, 2, 3, 4, 5, 6, continually into one another; and the last product gives the number of changes.

ALTERNATIVEMENT, in music, to play or sing two airs by turns, several times over.

ALTERN BASE, in trigonometry, a term used in contradistinction to the base. Thus in oblique triangles, the true base is either the sum of the sides, and then the difference of the sides is called the altern base; or the true base is the difference of the sides, and then the sum of the sides is called the altern base.

ALTHAEA, in botany, marsh-mallow, a genus of the polyandria order, belonging to the monadelphia class of plants; and, in the natural method, ranking under the thirty-seventh order, Columnifera. The characters are: CAL. a double perianthium, the exterior one nine cleft: COR. consists of five petals, coalesced at the base: STAM. numerous filaments inserted into the corolla; the anthers are kidney shaped: PIST. an orbicular germen; a short cylindrical stylus; and numerous bristly stigmata, the length of the stylus: PER. numerous arilla: SEEDS solitary, and kidney-shaped. There are three species, viz. 1. A. cannabini, or shrubby marsh-mallow, is a native of Hungary and Istria. 2. A. Hirsuta, or hairy marsh-mallow, a native of Spain and Portugal. 3. A. Vulgaris, or common marsh-mallow, a native of Britain, with a perennial root, and an annual stalk, which perishes every autumn.

ALTHAEA FRUTEX. See **HIBISCUS**.

ALTHAEA, in medicine. The Althaea vulgaris, is the only species used. The whole plant, especially the root, abounds with a mild mucilage. It has the general virtues of an emollient; and proves serviceable in a thin acrimonious state of the juices, and where the natural mucus of the intestines is abraded. The root is employed externally for softening and maturing hard tumours; chewed, it is said to give ease in difficult dentition of children.

ALTHAEA is also applied, in pharmacy, to an officinal syr^{up}, decoction, and ointment, prepared from the althaea vulgaris. It was once an ingredient in the compound powder of gum tragacanth, and the oil and plaster of mucilages.

ALTHAEA, in mythology, the daughter of Theseus, wife of Eneus, king of Calydon, and mother of Meleager.

ALTHEIM, a market town of Wirtemberg, in the district of the Danube; also a market town of Austria, in the bailiwick of Braunau, consisting of 130 large wooden houses.

ALTHIOPR PORT, is in E. long. 223°. 55' and N. lat. 88°. 11', on the north-west coast of King George the Third's archipelago, between Point Lucan and Point Lavinia. Several islands and rocky islets are at its entrance; but on each side of them there is a spacious navigable channel. The surrounding country is composed of rocky eminences, covered with forests, consisting in general of pine trees.

ALTHIOU GI', conj. All; though: though is the imperative *Daf* or *Dafig* of the Ang. Sax. verb *Dafian*, to allow, permit, grant, yield; Tooke. Albeit, allowed, permitted, admitted.

Take any brid and put it in a cage,
And do all thin contente and thy corage,
To foster it tenderly with mete and drinke
Of all deintes that thou canst bethinke,
And kepe it all so clenely as thou may
Although the cage of gold be never so gay,
Yet had this brid by twenty thousand fold
Lever in a forest that is wide and cold,
Gon eten worms and swiche wretchedness:
For ever this brid will don his busineesse
To escape out of this cage whan that he may,
His libertee the bird desireth ay.

Chaucer Manciple's Tale.

We all know, that many things are believed, *although* they be intricate, obscure, and dark; *although* they exceed the reach and capacity of our wits; yea, *although* in this world they be no way possible to be understood.

Me the gold of France did not seduce,
Although I did admit it as a motive,
The sooner to effect what I intended.

Hooker.

Shakspeare.
The stress must be laid upon a majority; without which the laws would be of little weight, *although* they be good additional securities.

Swift.

ALTICA, in entomology, a division of the genus cantharis, according to Fabricius, consisting of the insects of that tribe, which are of an oblong shape, and have the lip bifid.

ALTICOZZI (Lorenzo), a Jesuit of Cortona, who died at Rouen, 1777, was the author of several polemical treatises, especially one in reply to Beausobre on Manicheism; but his principal work is the Sum of St. Augustine, six

quarto volumes, containing an able account of the rise and progress of the Pelagian heresy.

ALTIMAR, in mineralogy, burnt copper.

ALTIN, **ALTAY**, or **TELETZK**, a lake in Siberia, from whence issues the river Ob, or Oby. By the Kalmucks it is called Altinor. It is said to be near ninety miles long and fifty broad, with a rocky bottom. The north part of it is sometimes frozen so hard as to be passable on foot, but the southern part is never covered with ice. It is in the government of Kolhyvane.

ALTIN, in commerce, a coin both of silver and copper in Russia, worth three copecs, one hundred of which make a ruble, or about four shillings and sixpence sterling. The silver altins under Peter I. had on one side the eagle, and on the other, with the date of the year, the word Altinik. They have been latterly disused.

ALTINCAR, or **ALTINEAR**, among mineralists, a species of factitious salt, used in the fusion and purification of metals. It is a sort of flux powder. Divers ways of preparing it are given by L Bavius.

ALTING (Henry), professor of divinity at Heidelberg and Groningen, was born at Emden in 1583, and chosen in 1605 preceptor to the three young counts of Nassau, Solms, and Izenberg. After various difficulties he settled at Groningen, where he continued till his death, August 25, 1644. His works are, 1. Notæ in Decadem Problematum Joannis Behm de Glorioso Dei et Beatorum Cœlo, Heidelberg, 1618. 2. Loci Communes, 3 vols. Amst. 1646. 3. Exegesis Augustanæ Confessionis, Amst. 1647. 4. Methodus Theologiae, 4to. Amst. 1654. 5. Historia Ecclesiastica Palatinæ, 4to. Amst. 1644. 6. Explicatio Catacheseos Palatinæ, 4to. Amst. 1646.

ALTING (James,) son of the former, was born at Heidelberg in 1618, and travelled into England in 1660, where he was ordained by the learned Dr. Prideaux, bishop of Worcester. He was afterwards professor at Groningen, and died August 20, 1679. He wrote, 1. Dissertations on Oriental antiquities. 2. Commentaries on many Books of the Bible. 3. A Syrio-Chaldaic Grammar. 4. A treatise on Hebrew Punctuation; making together 5. vols. fol. Amst. 1687. There were other learned members of this family, whom our limits will not allow us to notice.

ALTINGAT, in mineralogy, rust of copper.

ALTONANT, *adj.* Lat. *altus*, high; *sono*, to sound. High-sounding.

For it stood greatly with reason, seeing his lord and master changed his estate and vocation, that he should alter likewise his denomination, and get a new one, that were famous and *altonant* as became the new order and exercises which he now professed.

Shelton's Trans. Don Quixote, Ed. 1652.

ALTISSIMO, in music, or altiss., an Italian epithet for notes above F in alt.

ALTISTA, in music, an Italian name for the vocal performer who takes the alto primo part.

ALTITHI, in botany, a name given to the plant of which the asafetida of the shops is the gum.

ALTITUDE, *n.* *Altitudo*, Lat. Height.

Ten masts attach'd make not the *altitude*,
Which thou hast perpendicularly fall'n. *Shaksp.*

She shines above, we know, but in what place,
How near the throne, and heav'n's imperial face,
By our weak opticks is but vainly guess'd;
Distance and *altitude* conceal the rest.

Dryd.

ALTITUDE, in geometry, is the third dimension of a body considered with respect to its elevation above the ground; and is otherwise called its height or depth: the former when measured from bottom to top, the latter when measured from top to bottom. The altitude of a figure is the distance of its vertex from the base, or the length of a perpendicular let fall from the former to the latter, as B. A. in plate I. fig. 1. MISCELLANEOUS.

The altitude of a terrestrial object is the height of its vertex above some horizontal plane assumed as a base in physical geography. The altitudes of mountains are measured from the general level of the ocean; that is, the altitude of a mountain is the difference between the mean terrestrial radius and the distance of the vertex of the mountain, from the centre of the earth. Altitudes are distinguished into accessible and inaccessible. The accessible altitude of an object is that to whose base there is access to measure the nearest distance to it on the ground. The inaccessible altitude of an object is that to whose base there is not free access, by which a distance can be measured to it, by reason of some impediment, as water, and the like. If an altitude cannot be measured by stretching a string from top to bottom, which is the direct and most accurate way, some other expedient is resorted to, by measuring some other line or distance, which may serve as a basis, in conjunction with some angles, or other proportional lines, to compute, geometrically, the altitude of the object sought. There are various ways of measuring altitudes, or depths, by means of different instruments, and by shadows, or reflected images, on optical principles, &c. The instruments mostly employed in measuring altitudes, are the quadrant, theodolite, geometrical square, line of shadows, &c. There are also various ways of computing the altitude in numbers, from the measurements taken as above, by geometrical construction, trigonometrical calculation, or by simple numerical computation, from the property of parallel lines, &c.

We exhibit the following problems, as the most familiar illustrations of the above theoretical remarks.

PROBLEM I.
To measure the altitudes of objects by means of their shadows.

This is one of the most ancient methods of measuring altitudes, of which we have any record. It is said to have been first employed by Thales, in measuring the heights of the pyramids in Egypt: with this view he erected a staff, and at a certain time measured the length of its shadow; at the same time the length of the shadow of the pyramid was also ascertained: then knowing the length of the staff, he made the height of the pyramid to bear the same proportion to the length of the staff, as the shadow of the former to the shadow of the latter. This method may be more explicitly illustrated: At any time when the sun shines, erect a staff *a b*, fig. 2, perpendicularly at *a*, and measure the

length of its shadow; at the same time cause the length of the shadow of the proposed object, AB fig. 2, to be also taken. Then, by similar triangles, as

$$ca : ab :: CA : \frac{ab \times CA}{ca} = AB$$

the altitude required.

If the altitude be inaccessible, as in fig. 3, but still such that the difference of the lengths of its shadow, taken at two different times, can be ascertained, the altitude may be found nearly the same as in the last example.

Make $ab = a$, $ac = b$, fig. 2, and the unknown length of the shadow of AB, viz. $AC = x$; let the second shadow of the rod, $ac' = b'$, the second shadow of the object, $AC' = x \pm d$, and the height AB of the object $= y$: then, by the preceding proportion,

$$\text{1st operation, } b : a :: x : y;$$

$$\text{2d operation, } b' : a :: x \pm d : y;$$

whence, by subtraction,

$$b \otimes b' : a :: d : y;$$

that is,

$$AB = y = \frac{ad}{b \otimes b'},$$

the altitude required.

PROBLEM II.

To measure altitudes by means of staves.

Let AB (fig. 5. plate I. MISCELLANEOUS) represent an object, of which the altitude is required. Being provided with two rods, or staves, of different lengths, plant the longest of them, as CF, at a certain measured distance from the base of the object; then, at a further distance, plant the second or shortest staff ED, in such a manner that the tops of the two, E and F, may be in a line with the top of the tower B.

This being done, measure the distance ID, as also the length ED, and we shall have, by similar triangles, as

$$ID : ED :: IA : AB;$$

that is, by multiplying the second and third terms together, and dividing by the first, we shall have the altitude of the tower AB, or

$$AB = \frac{ED \times IA}{ID}.$$

For example, suppose IA = 100 feet, ID = 8 feet, and ED = 4 feet, then

$$AB = \frac{4 \times 100}{8} = 50 \text{ feet},$$

the altitude of the tower.

In some cases where the base of the object is inaccessible, two operations similar to the one above-mentioned become requisite. For familiarizing this mode of calculation, see fig. 5, plate I. MISCELLANEOUS.

Let ID = a , ED = d , also the unknown distance IA = x , and the required altitude of the object = y ; then in the second operation, in which both the staves must be replanted, make the second distance ID = a' , and the second unknown distance IA' = $x \pm c$, c being the distance between the two stations of the shorter staff ED, E'D'; the lengths of the staves still remaining the same. Now, from the preceding proportion we shall have (by substituting for ID, ED, IA, and AB, the above letters),

$$\text{1st operation, } a : d :: x : y;$$

2d operation, $a' : d :: x \pm c : y$;
whence, by subtraction,
 $(a' \otimes a) : d :: c : y$;
consequently,

$$y = AB = \frac{dc}{a' \otimes a}.$$

PROBLEM III.

To measure an altitude by means of a geometrical square.

The geometrical square is nothing more than a square board or frame, having one of its sides divided into equal parts; (figure of the instrument, fig. 6, plate I. MISCELLANEOUS), a plumb-line being then suspended at one of its angles, falls perpendicularly, and marks off a certain number of those divisions, from which the height of the object may be determined, as follows:— Having fixed the instrument at any place, C, as fig. 7. plate I. MISCELLANEOUS, turn the square about the centre of motion if it be mounted on a stand, or otherwise adjust it by holding it in your hands, till the top of the object, B, is perceived in the direction of the sights, or of the side of the square, and note the number of divisions, Ff, cut off by the plumb-line; then having measured the distance, CA, we have, by similar triangles,

$$EF : Ff :: CA : BH,$$

$$\text{that is } BH = \frac{CA \times Ff}{EF},$$

and, consequently,

$$AB = \frac{CA \times Ff}{EF} + DC,$$

the altitude sought.

In the case of an inaccessible object, two observations must be made similar to that above; in which the only variable lines will be Ff, CA. Let, therefore, the side of the square = s , and the variable part Ff = a , in the first observation, and a' in the second; also put the unknown distance = x , in the first case, and $x \pm c$ in the second; so that c will be the distance of the observer's two stations, and make the required height of the object = y . Then, on the same principles as those above,

$$\text{1st operation, } s : a :: x : y;$$

$$\text{2d operation, } s : a' :: x \pm c : y;$$

whence by equality,

$$a = a' :: x \pm c : x,$$

$$\text{and } a \otimes a' :: a' :: c : x,$$

$$\text{therefore, } x = \frac{a'c}{a \otimes a'},$$

and by the first equation,

$$y = \frac{ax}{s} \text{ or } y = \frac{a'c}{s(a \otimes a')}$$

the altitude required.

PROBLEM IV.

To measure the altitude of objects by means of optical reflection.

Place a mirror, or other reflecting surface horizontally in the plane of the figures' base, as in fig. 8. I. (in which case we suppose the object to be accessible), and measure the distance CA. Now, retire back in the direction AC to D, till the eye observes the top, of the object exactly in the centre of the mir-

ror, which, for the greater degree of accuracy, may be marked by a line across it. Then, having measured the distance DC, and ascertained the height of the eye of the observer, it will be, from the known laws of reflection, viz. the equality of the angles of incidence and reflection, as

$$DC : DE :: CA : \frac{DE \times CA}{DC} = AB,$$

the altitude of the object required.

When the object is inaccessible and CA cannot be measured, two such operations as that above must be employed, as in fig 9, 1. Thus, let ED=a, DC=d, and the unknown distance CA=x; also, let d' denote the analogous distance D' C' in the second operation, and x±c the second distance C' A, or c=the distance between the two stations of the mirror; and let the required height of the object=y; then, substituting the above letters in the preceding proportion, we shall have,

$$1st \text{ operation}, \quad d : a :: x : y;$$

$$2d \text{ operation}, \quad d' : a' :: x \pm c : y,$$

whence, by subtraction,

$$d \otimes d' : a : : c : y;$$

and, consequently,

$$y = AB = \frac{ac'}{d \otimes d'}$$

the altitude sought.

All these problems, for inaccessible objects, will give the distance of the objects as well as their altitude. Thus,

Prob. I. The distance

$$CA = x = \frac{by}{a} = \frac{bad}{a(b \otimes b')}$$

Prob. II. The distance

$$EG = x = \frac{ay}{d} = \frac{adc}{d(d \otimes a')}$$

Prob. III. The distance CA=x= $\frac{a'c}{(a \otimes a')}$

Prob. IV. The distance

$$CA = x = \frac{dy}{a} = \frac{acd}{a(d \otimes d')}$$

Other methods of taking altitudes may be seen in Dr. Hutton's Mensuration, Bonnycastle's Trigonometry, &c.

The method of taking considerable terrestrial altitudes, of which those of mountains are the greatest, by means of the barometer, is very easy and expeditious. It is done by observing, on the top of the mountain, how much the mercury has fallen below what it was at the foot of the mountain. See BAROMETER.

ALTITUDE, in astronomy, is the arch of a vertical circle, measuring the height of the sun, moon, star, or other celestial object, above the horizon.

This altitude may be either true or apparent. The apparent altitude is that which appears by sensible observations. The true altitude is that which results by correcting the apparent, on account of refraction and parallax.

The quantity of the refraction is different at different altitudes; and the quantity of the parallax is different according to the distance of the different luminaries: in the fixed stars this is too small to be observed; in the sun it is only

about 8 $\frac{1}{2}$ seconds; but in the moon, at a mean proportion, it is about 58 minutes.

The altitude of a celestial object may be accurately determined, by measuring the arc of an oblique great circle intercepted between the star and the horizon, and the inclination of the same great circle to the horizon. This may be put in practice by means of the equatorial, thus: let the sine of the estimated altitude of the object be s, elevate the equatorial circle above the horizon to an angle, the sine of which= \sqrt{s} , rad.1. The declination circle being set to 0, direct the line of collimation to the star, by the equatorial and azimuth circles moved in their own planes; observe the arc of the equatorial circle intercepted between the index and VI; if the sine of this arc=p, the sine of the observed altitude will be equal to $p\sqrt{s}$, radius being 1. This indirect method is, in general, less exposed to errors than the direct method in about the proportion of 1 to 7. See Atwood's Lectures, p. 198, 227.

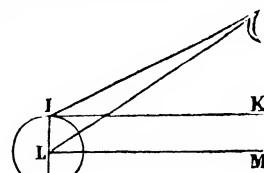

THE MERIDIAN ALTITUDE OF THE SUN, OR ANY CELESTIAL OBJECT, is an arch of the meridian intercepted between the horizon and the centre of the object upon the meridian. The altitude of a celestial body is greatest when it comes to the meridian of any place (the poles of the earth excepted, for there the altitude of a fixed body is subject to no variation); and the altitude of any star which sets not, is least, and the depression of any star which does set is greatest, when in the opposite part of the meridian.

ALTITUDE OF THE POLE is an arch of the meridian intercepted between the horizon and the pole: it is equal to the latitude of the place.

ALTITUDE OF THE EQUINOCTIAL is the elevation of that circle above the horizon, and is always equal to the complement of the latitude.

REFRACTION OF ALTITUDE is an arch of a vertical circle, whereby the altitude of a heavenly body is increased by refraction.

PARALLAX OF ALTITUDE, is an arch of a vertical circle, by which the true altitude, observed at the centre of the earth, exceeds that which is observed on the surface; or the difference between the $\angle LM$ and $\angle IK$ of altitude there; and it is equal to the angle $I \parallel L$, formed at the moon, or other body, and subtended by the radius IL of the earth.

The ALTITUDE of the mercury, in the barometer, marked by degrees on the face of that instrument, is the chief object of its construction. The mean altitude of the mercury at London for every day in several years, is about 29.87 inches.

ALTITUDE, in astrology, denotes the second of the five essential dignities, which the planets acquire in virtue of the signs they are found in. In this sense, altitude is otherwise called exaltation.

ALTITUDE INSTRUMENT, or equal altitude instrument, is that used to observe a celestial object when it has the same altitude on the east and west sides of the meridian. See ASTRONOMY.

ALTITUDE, MERIDIAN. The meridian being a vertical circle; a meridian altitude, that is, the altitude of a point in the meridian, is an arch o' the meridian intercepted between it and the horizon. See ASTRONOMY.

ALTITUDE or MOTION, the measure of any motion, reckoned according to the line of direction.

ALTITUDE OF THE EYE, in perspective, is a right line let fall from the eye, perpendicular to the geometrical plane.

ALTIVAIG, an island on the coast of the parish of Kilmuir, in the isle of Sky, with a good harbour.

ALTKIRCH, or ALTKIRK, a town and castle of France, in the department of the Upper Rhine, the chief town of an arrondissement on the river Iller, 6 miles south-west of Michhausen.

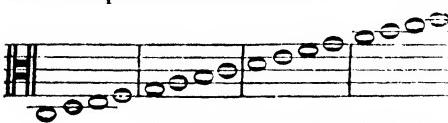

ALTMANN (John George), a Swiss historian and divine, was born in 1697, and died in 1758, curate of Inns, and professor of moral philosophy and Greek at Berne. He wrote, 1. *Tempe Helvetica*, 6 vols. 8vo. 1735-43. 2. *Versuch einer Historisch-und Physischen Beschreibung der Helvetischen Eisberg*, 8vo. Zurich, 1751. 3. *Meletemata Philologica Critica, quibus Difficilioribus N. Test. Locis ex Antiquitate Lux affunditur*, 3 vols. 4to. 1753. 4. *Principia Ethica ex Monitis Legis Naturae et Praeceptis Religionis Christianae deducta*, 2 vols. 8vo. Tübing. 1754.

ALTMANNSTEIN, a market-town of Bavaria, in the circle of the Regen, fourteen miles from Ingolstadt.

ALTMARK, a division of the Mark of Brandenburg, bounded on the east by the Elbe, Magdeburg, and the Triegnitz; on the south by Magdeburgh, and on the west and north by Brunswick-Lunenburg. It contains, on an extent of 1670 square miles, thirteen towns, six royal bailiwicks, twenty-seven manors, 494 villages, 16,938 houses, and 98,305 inhabitants.

ALTMULL, a river of Germany, which rises in Franconia, runs south-east by Anspach, then turns east by Pappenheim and Aichest, and at last falls into the Danube, at Kelheim, 12 miles above Ratisbon.

ALTO, high, in music, as alto viola, the tenor violin, in opposition to the bass viol, to which instrument or violoncello, the tenor strings are tuned octaves as C^e. G^e. D^d. A^a. The following is the complete scale on the tenor.

ALTO et BASSO, or in **ALTO**, and in **BASSO**, in law, signifies the absolute reference of all differences, small and great, high and low, to some arbitrators or indifferent persons. The form of submission is in Latin, *pateat universis, &c.* signifying 'Know all men by these presents, that A. B. of C. and D. E. of F. have placed themselves in Alto et Basso under the arbitration of two, three, or more men; viz. respecting a certain complaint now depending in court between them.'

ALTO CONCERTANTE, the tenor of the little chorus.

ALTO TENORE, in music, the upper or counter-tenor part in music of several parts. Alto cliff, the cliff placed on the third line of the stave.—Alto concertante, the tenor of the little chorus which sings throughout.—Alto primo, the first or upper alto, in distinction from the—Alto secondo, or lower alto.—Alto ripieno, the tenor of the great chorus which performs in the full parts.—Alto viola, the small tenor of the violin.

ALTO RELIEVO, in sculpture, a representation of figures and other objects against a flat surface or back ground, and differs from basso relieve only in the work being much more relieved and brought forward.

ALTOBELE, a lofty island of a sugar-loaf shape, near the north of Hispaniola, long. 71°. 18'. W. lat. 17°. 38'. N.

ALTOGETHER, *adv.* All; to; gather. See **GATHER.** All collected, united, conjoined. Hence, wholly, unitedly, completely.

It is in vain to speak of planting laws, and plotting policy, till the people be *altogether* subdued.

Spenser's State of Ireland.

We find not in the world any people that hath lived *altogether* without religion.

Hooker.

If death and danger are things that really cannot be endured, no man could ever be obliged to suffer for his conscience, or to die for his religion; it being *altogether* as absurd to imagine a man obliged to suffer, as to do impossibilities.

South.

I do not *altogether* disapprove of the manner of interweaving texts of scripture through the style of your sermon.

Swift.

ALTO-MUNSTER, a market town in the district of Aichart Bavaria, 20 miles north-west of Munich.

ALTON, a parish and market town in the hundred of that name, Hants, ten miles south-west from Alresford, and from London forty-seven miles west-south-west, containing 2500 inhabitants. The church, though small, is neat; and the town is composed of three streets, standing on the river Wye. Manufactures of serges and of druggets are carried on here to a great extent; and white yarn and worsted articles of superior descriptions are also manufactured here. The town is almost surrounded by hop plantations. It contains a presbyterian and a quaker's meeting, and a famous free-school. Market day, Saturday.

ALTONA, or ALTENA, a large city, two miles west of Hamburg, on the Elbe, in the lordship of Pinneberg, and belonging to the *crown* of Denmark. It was originally a village, but being united, with the rest of Pinneberg, in 1640, to the kingdom of Denmark, it so increased in size as to receive, in 1664, the rights and privileges of a city. The present number of houses is about 3120, and the inhabitants at least 30,000, partly Lutheran, partly Calvinist, and partly Catholic. Multitudes of Jews are also to be met with, who pay yearly for their protection the sum of 2000 ducats. The commerce in all branches is considerable. The number of vessels belonging to the harbour is upwards of 100; and the most common destinations, exclusive of the ports in the Baltic and North seas, are the Mediterranean, and the various fisheries for herring,

cod, whales, and seals. Ship-building is an important employment here, and there are also manufactures of velvet, silk, stuffs, calico, stockings, leather, gloves, tobacco, vinegar, starch, wax, and looking-glasses, with sugar refineries and distilleries. The principal public establishments are: an academy founded by Christian VII., a library, a house of correction, and an orphan-house. In 1713 Altona was, with the exception of 100 houses, burned to the ground by the Swedish general Steinbock. It is now beautifully rebuilt.

ALTORF, in Switzerland. See ALTDORF.

ALTORF, a town of Germany, in the circle of the Rezat, Bavaria. It contains 23 public buildings, 223 dwelling houses, and (in 1803) 2070 inhabitants, of whom 220 belonged to the now-suppressed university. The culture of hops is extensively pursued by the inhabitants of this town and neighbourhood; and brewing is likewise an important branch of their industry. 12 miles east-south-east of Nuremberg, 34 east-north-east of Anspach, Lon. 11°. 20'. E. lat. 49°. 23'. N.

ALTORE, a market town and upper bailiwick of Suabia, in the kingdom of Wirtemberg, district of the lake of Constance. It contains 100 inhabitants. 5 miles north-east of Wirtemberg.

ALTORF, a market town of Hungary, in the county of Zyps, 18 miles north of Leutsch.

ALTRANSTADT, a town in Saxony, famous for the treaty between Charles XIII. king of Sweden and Augustus elector of Saxony, in 1706, wherein the latter resigned the kingdom of Poland.

ALTRAUCH, a market town of Moravia, in the circle of Iglaeu, south of the town of Iglaeu.

ALTRINGHAM, or ALTRINCHAM, a market town of Chester, on the canal from Runcorn to Manchester. It has several manufactories of yarn, worsted, and cotton, an annual fair and a weekly market. Population 2032. Distant from Knutsford 7 miles, and 179 from London.

ALTUN KUPRI, or ALTOUN KOPRI, the Golden Bridge, or many bridges, a town of Asiatic Turkey, in the pachalic of Bagdad, situated on the north bank of the Little Zab. A large Turkish garrison is always kept here. Population 2000. Distant about 210 miles from Bagdad, ninety south-east of Mosul. Long. 43°. 20'. E. lat. 35°. 45'. N.

ALTZEY, a town and upper bailiwick in the grand duchy of Hesse-Darmstadt, Germany, lying on the Selsach, and formerly belonging to the palatinate of the Rhine. It contains about 3051 inhabitants, and is twenty-three miles north-west of Worms.

ALVA (Don Ferdinando Alvares de Toledo, duke of Alva), was born in 1508, of an illustrious Spanish family, and made a general by Charles V. at the early age of thirty. He received his military education under his grandfather, Frederic of Toledo, and was considered as an officer of great promise. In 1542 he defended Perpignan against the arms of France; and four years afterwards was appointed generalissimo of the imperial army. At the siege of Metz, in 1552, he was entrusted with the chief command under the emperor, and was not

long after appointed the emperor's vicar-general in Italy; but instead of driving the French from Piedmont, he was obliged to conclude the campaign with the surrender of part of it; and in the following year, by the resignation of Charles in favour of his son, was transferred to a new master. His military talents now appeared, united with an unrelenting temper, and as much ferocious cruelty and oppression as ever stained the page of history. After the general peace established in Europe in 1559, the king of Spain found leisure to attempt a more complete reduction of his revolted provinces of the Netherlands, and determined to employ Alva to compel future submission, and to punish past revolt. He entered Brussels in August 1567, and his arrival spread consternation and dismay over all the provinces. The Prince of Orange, with many thousands of less exalted character, left the country, and happy would it have been for many more had they followed their example. Counts Egmont and Horn, two of the most distinguished patriots, were immediately imprisoned, tried, and executed. In a short time the duchess of Parma, the regent, obtained leave to quit her government, and Alva was thus left at liberty to act without responsibility or control. He had not only allotted to him the command of the army, but the presidency of the council of state, of justice, and of the finances. To the protestants he allowed a month for leaving the country; but the blood-hounds of the inquisition were secretly set upon them, and ordered to seize their prey. A council of twelve, called the council of tumults, of which Alva constituted himself president, assisted the court of inquisition. From his troops and his councils the people fled in consternation, and 20,000 of them were in a short time dispersed over France, England, and Germany. In a few months nearly 2000 persons had suffered by the hands of the executioner. The details of the proceedings by which these unfortunate victims of persecution were detected and secured; the atrocious injustice which met them when dragged before the tribunal of vengeance; and the tortures and agonies which ingenious cruelty invented for their execution, were never exceeded, if equalled, by any other efforts of the holy office. To have once frequented a protestant meeting was a sufficient proof of guilt, which could not be atoned for by any subsequent abjuration of error; and the slightest punishment inflicted was hanging or drowning. The members of the bloody council itself at last began to be shocked at their own work, and several of them sought their dismission from office. Out of the twelve there seldom assembled more than three or four at a time of more hardened hearts or more flaiming zeal. The citizens of Antwerp ventured to petition Alva to abate the rigour of persecution; but their request was received with scorn by the haughty bigot. Some of the catholic nobility presented remonstrances to the king against the cruelty of their governor; but he was equally cruel and bigoted. Even the exhortations of the head of the church to moderation were disregarded, and the inquisition continued the work of blood with insatiable fury. The people were finally driven

to seek relief in open rebellion to an authority which they would otherwise have respected, and found a leader happily in the prince of Orange. He had been summoned to appear before Alva when he entered the Netherlands; but by his prudent suspicion of the designs of that perfidious chief saved himself from the fate of some of his more unsuspecting companions. He now prepared to oppose him in the field, and published a manifesto, in which he declared the change that had taken place in his religious sentiments, and called upon the protestants to join him in the overthrow of superstition and tyranny. He was, however, unsuccessful in his first attempts, and obliged to disband his army. Many of the persecuted, in the mean time, came to England, where they enjoyed the freedom of religious worship, and the benefits of political protection, while they enriched their new country with the introduction of various manufactures formerly unknown to its inhabitants. The success of Alva over the prince of Orange, and the congratulations of the Pope for his efforts to suppress heresy, now inspired him with increased arrogance, and led to those absurdities of wanton despotism which produced the subsequent difficulties of his administration, and eventually established the republic of Holland. Heedless of the people, who had hitherto been taxed by their native princes, he determined to levy contributions by his own authority, and to increase the impositions to such an extent as not only to provide for his present exigencies but lay up a fund for the future. His religious persecutions affected only a part of the states. This arbitrary proceeding threatened the whole, and united them all in opposition to his authority. They assembled and remonstrated. The prince of Orange, seeing the general discontent, again prepared for invasion; and those who had been driven into exile by persecution, fitted out armed ships, and visited the coasts of their country as enemies and pirates. They made prizes of all the Spanish ships they met with on the English or Flemish coasts. The revolt in North Holland became general. A meeting of the states, held at Dort, determined to acknowledge the prince of Orange as their governor and commander of their forces by sea and land. At last the Spanish troops mutinied, and the fleet of the governor was defeated by the rebel Zealanders. Upon this Alva solicited leave to retire; and Philip, seeing the little hopes of reducing the rebels under such an unpopular chief, granted his request. He left the Netherlands accordingly in 1573, and retired to his estates until Philip again commanded the assistance of his sword to reduce the kingdom of Portugal. At the advanced age of seventy he accomplished this service, and did not long survive it. He died in 1582, leaving few equals in this career of infamy in modern times. See *Robertson's Charles V.* *Watson's Philip II.* &c.

ALVA, a town and parish in Stirlingshire, on the river Deveron, four miles north of Alloa; containing 200 houses and 1150 inhabitants. It has been long distinguished for the variety of minerals with which it abounds. Some time since, a valuable vein of silver-ore was wrought

here; and considerable quantities of native malleable silver have been dug. Cobalt, arsenic, lead, copper, and iron, have also been discovered at the foot of the hills. Extensive seams of coal are now working. The town is seven miles north-east of Stirling, at the foot of the Ochil-hills. The manufacture of serges and Scotch blankets has been carried on here for more than a century.

ALVA DE TORMES, a considerable town in Spain, in the province of Leon, with strong castle formerly belonging to the famous duke of Alva. It is seated on the north bank of the river Tormes, twelve miles south-east of Salamanca, and was frequently occupied by the British in the peninsular war of 1812.

ALVAR, a district of the province of Agra, Hindostan, on the south-west of Delhi, situated between the twenty-seventh and twenty-ninth degrees of latitude. It has been called Mewat by the Mahomedan historians. In the Ayeen Acberry it is said to be capable of furnishing 6514 cavalry, and 42,020 infantry to the state. This district is in a remarkably uncultivated state. In modern times it has yielded a barbarous race of native soldiers, who were occasionally subsidized by the various warlike chiefs of the last century, for the purpose of spreading the greater devastation in their marches. Its facilities for agriculture, however, are not few. It has the west side of the Jumna for its eastern boundary, to an extent of about ninety miles, and stretches westward about 130 miles from that river. At present it is subject to the Macherry Rajah, who has fixed his capital at the city of this name, and with whom a treaty of alliance and friendship was concluded by the British in 1803.

ALVAR, a city of Hindostan, in the province of Agra, the capital of the district of Alvar, and under the government of the Macherry Rajah. It is strongly fortified, and stands about seventy-seven miles south-south-west of Delhi, and eighty-four north-west of Agra, in N. lat. 27° 41' and E. long. 76° 40'.

ALVARES, a town of Portuguese Estremadura. Inhabitants 1500.

ALVARJD, or ALVARIUS, a judge among the Spanish Moors.

ALVARADO, an abundant river and town of Mexico, in the intendancy of Vera Cruz. The former has its rise in the lofty ridges of the Table Land, forty miles south-west of Guaxaca. It is joined by several other streams, which swell it to a large size, and near the town runs into the gulf of Mexico, about twelve leagues south-south-east of Vera Cruz. Long. 96°. 54'. W. lat. 18°. 40'. N.

ALVARISTS, in ecclesiastical history, a branch of the Thomists, so called from their leader Alvarez, who maintained the efficacy of divine grace, in distinction from the former, who maintained its sufficiency.

ALUCITÆ, in entomology, a subdivision of insects belonging to the genus of phalæna, and of the lepidoptera order, in the Linnæan system; comprehending eight species.

ALUCO, or sacred owl, in ornithology, a species of the owl, or strix, with rusty head, black irides, and the primary wing-quills serrated at

the edges. It is the *la hulotte* of Buffon, the *ulula* of Briss. Gesn. and Aldr. the black owl of Albin, and the brown owl of Pennant and Lewin. Its cry, a kind of howl, resembling that of wolves, furnished its name *ulula*, and the German *huhu*, or *hoo-hoo*. It is said to be considered as sacred by the Calmucks, for having contributed to preserve the life of their great monarch, Jenghis Khan.

ALUDELS, in chemistry, earthen tubes or vessels used in sublimations. They are without a bottom, and are fitted into one another as occasion may require. At the bottom of the furnace there is a pot holding the matter that is to be sublimed; and at the top there is a head to receive the flowers that sublime up.

ALVEARE, in conchology, a species of *trochus* with a plicated nodulose shell, striated transversely, and adorned with bands of concatenated points, funnel-shaped umbilicus, and crenulated columella. Found in India; the shell is coloured with a mixture of green and white, pearly within.

ALVEARIUM, an alveary, or bee-hive, from *alveus*, a cavity; in allusion to the *alveoli*, or cells in bee-hives. Some of the ancients use also the word *alvearium* for a bee-house, more usually called *apiary*.

ALVEARIUM, in anatomy, the bottom of the toncha, or hollow of the auricle, or outer ear.—The *alvearium auricularia* is a cavity, terminating at the *meatus auditorius*, wherein that bitter yellowish excrement is collected, called *cerumen*, or *ear-wax*.

ALVEARIUM, in literature, is used figuratively for a collection.

ALVEOLARIS PROCESSUS, in anatomy, another name for the *maxillaria superiore ossa*.

ALVEOLI, among naturalists, those waxen cells in the combs of bees, wherein their honey is deposited.

ALVEOLI, in anatomy, those little sockets in the jaws, wherein the teeth are set. The *alveoli* are lined with a membrane of exquisite sense, which is wrapt about the roots of each tooth; from whence, and from the nerve, proceeds that pain called *odontalgia*, or tooth-ach. Of these *alveoli* there are usually sixteen in each jaw. Some writers speak of teeth growing without *alveoli*. Holler gives an instance of a person, whose teeth were of a piece with his jaws, without any insertion into *alveoli*.

ALVEOLUS, in natural history, a sea fossil of a conic figure, composed of a number of cells, like bee-hives, joined into each other, with a pipe of communication.

ALUESEN, in botany, the *pucedanum*, or *hog's-fennel*.

ALVEUS, a channel, Lat., in anatomy, the tumid lacteal branches arising from the receptaculum chyli, under the diaphragm.

ALVEUS, in antiquity, a small vessel, or boat, made out of the trunk of a single tree, by boring or cutting it hollow. Such was that wherein Romulus and Remus are said to have been exposed.

ALVIDUCA, from *alvus*, the belly, and *ducere*, to draw; a term used for purgative medicines.

ALUM; *alumen*, Lat. A kind of mineral salt, of an acid taste, leaving in the mouth

VOL. I

a sense of sweetness, accompanied with a considerable degree of astringency. We give the following definition from a valuable and standard author:—‘A massive mineral, of a blackish-brown colour, a dull lustre, an earthy and somewhat slaty fracture, sectile, and rather soft. By Klaproth’s analysis it contains, charcoal 19.65, silica 40, alumina 16, oxide of iron 6.4, sulphur 2.84, sulphates of lime and potash each 1.5, sulphate of iron 1.8, magnesia and muriate of potash 0.5, and water 10.75. Under the form of *Alum-slate*, it assumes two varieties; 1. Common. This mineral occurs both massive and in insulated balls of greyish-black colour, dull lustre, straight slaty fracture, tabular fragments, streak coloured like itself. Though soft it is not very brittle. Effloresces, acquiring the taste of alum.

2. *Glossy Alum-slate*, which is a massive mineral of a bluish-black colour. The rents display a variety of lively purple tints. It has a semi-metallic lustre in the fracture, which is straight, slaty, or undulating. There is a soft variety of it approaching in appearance to slate clay. By exposure to air its thickness is prodigiously augmented by the formation of a saline efflorescence, which separates its thinnest plates. These afterwards foliate in brittle sections, causing entire disintegration.’ The ancient naturalists allowed the parts of alum, natural and factitious. The natural is found in the island of Milo, being a kind of whitish stone, very light, friable, and porous, and streaked with filaments resembling silver. England, Italy and Flanders, are the countries where alum is principally produced; and the English *roche-alum* is made from a bluish mineral stone, in the hills of Yorkshire and Lancashire.—*Saccharine alum* is a composition of common alum with rose water and whites of eggs, boiled together to the consistence of a paste, and thus moulded at pleasure. As it cools, it grows hard as a stone.—*Burnt alum*, is alum calcined over the fire.—*Plumose* or *plume alum* is a sort of saline mineral stone, of various colours, most commonly white, bordering on green; it rises in threads or fibres, resembling those of a feather; whence its name from *pluma*, a feather. *Chambers*.—By long beating the white of an egg with a lump of alum, you may bring it, for the most part into white curds. *Boyle*.

Most of the alum to be met with is artificially prepared, though sometimes it is produced naturally. This native alum is mixed with heterogeneous matters, or effloresces in various forms upon the ores during calcination. It rarely occurs in a crystallized state, though it is said to be thus met with in Egypt, Sardinia, Spain, Bohemia, and other places. It is also found in the waters impregnated with fixed air, but very seldom in fountains or hot medicated waters. There are several kinds of alum to be met with; but these differ from one another only in being mixed with some salts which are not of the aluminous kind. The Roman alum has been considered as preferable to any other. It is usually met with in small crystals, and has a reddish colour, most probably owing to a small quantity of calx of iron, which, however, does not in the least impair its qualities. The other kinds of alum con-

2 Z

tain a portion either of vitriolated tartar or sal ammoniac, according to the nature of the alkali used in its preparation. Sir Torbean Bergman informs us, that the vegetable alkali, if pure, does not hurt the alum, though it be added in the preparation; but that the volatile alkali, by adulterating it with a portion of vitriolic sal ammoniac, renders it unfit for some purposes. The alum made by adding a portion of clay to the liquor, at the beginning of the boiling, he considers as equal if not superior to Roman alum. He informs us also, that a kind of alum some time ago began to be manufactured at Brunswick, which was equal in quality to the Roman alum.

Alum mines are said to have been first found in Italy, in 1460; and in the 16th century the art of alum making was begun in Germany and Spain, and a little before its conclusion works were established at Whitby in England, by Sir Thomas Chaloner, who had the honour of being excommunicated, by the reigning Pope, on that very account. King James I, by advice of his ministry, assumed the monopoly of it himself, and therefore prohibited the importation of foreign alum; and in 1625 the importation of it was further prohibited by the proclamation of Charles I. 'The greater part of this salt, factitious, being extracted from various mineral ~~ores~~ called alum ~~ores~~, such as, 1. Sulphurated clay. This constitutes the purest of all aluminous ores, namely, that of la Tolfa, near Civita Vecchia, in Italy. It is white, compact, and as hard as indurated clay, whence it is called petra aluminaris. It is tasteless and mealy; one hundred parts of this ore contain above forty of sulphur and fifty of clay, a small quantity of potash, and a little iron. Bergman says it contains forty-three of sulphur in one hundred, thirty-five of clay, and twenty-two of silicious earth. This ore is first torrefied to acidify the sulphur, which then acts on the clay, and forms the alum. 2. The pyritaceous clay, which is found at Schwensal in Saxony, at the depth of ten or twelve feet. It is a black and hard, but brittle substance, consisting of clay, pyrites, and bitumen. It is exposed to the air for two years; by which means the pyrites are decomposed, and the alum is formed. The alum ores of Hesse and Liege are of this kind; but they are first torrefied, which is said to be a disadvantageous method. 3. The schistus aluminaris contains a variable proportion of petroleum and pyrites intimately mixed with it. When the last are in a very large quantity this ore is rejected as containing too much iron. Professor Bergman very properly suggested that, by adding a proportion of clay, this ore may turn out advantageously for producing alum. But if the petrol be considerable it must be torrefied. The mines of Becket in Normandy, and those of Whitby in Yorkshire, are of this species. 4. Volcanic aluminous ore. Such is that of Solfaterra near Naples. It is in the form of a white saline earth, after it has effloresced in the air; or else it is in a stony form. 5. Bituminous alum ore is called shale, and is in the form of a schistus, impregnated with so much oily matter, or bitumen, as to be inflammable. It is found in Sweden, and also in the coal mines at Whitehaven, and elsewhere.'

Alum is often manufactured from saline earthy ores. The only place where this kind of ore is formed, in sufficient abundance to be worth working, is the Salfatara, a few miles from Naples, called by the ancients, 'Forum Vulcani, Campi Leucogei.' The white clayey soil of this plain being constantly penetrated by sulphureous vapours, and the exhalations during the night being for the most part mixed with the dew, are returned with it to the surface, and thus cause it to be covered with a light saline efflorescence: this, together with the earth to which it adheres, is daily collected and distributed into leaden caldrons, so as to nearly fill them two-thirds full; water is then poured upon it till it stands about 3 or 4 inches above the surface of the clay, and this in a few hours, by the assistance of the natural heat of the ground, in which the caldrons are set almost up to the brim, extracts the alum from the clay, forms it in rough crystals on the surface of the water, nearly in the mode that copper is obtained. These crystals are then taken out and worked in the first water; after which, fresh water is put into other boilers, and the crystals are dissolved for the purpose of purifying; the solution is then filtered into wooden coolers, and in a day or two affords a large quantity of pure colourless crystals. The author already alluded to describes alumina as one of the primitive earths, which, as constituting the plastic principle of all clays, loams, and boles, was called argil, or the argillaceous earth; but now, as being obtained in greatest purity from alum, is styled alumina. It was deemed elementary matter, till Sir H. Davy's celebrated electro-chemical researches led to the belief of its being, like barytes and lime, a metallic oxide.' This author further relates, 'The purest native alumina is found in the oriental gems, the sapphire and ruby. They consist of nothing but this earth, and a small portion of colouring matter. The native porcelain clays or kaolins, however white and soft, can never be regarded as pure alumina. They usually contain fully half their weight of silica, and frequently other earths. To obtain pure alumina we dissolve alum in twenty times its weight of water, and add to it a little of the solution of carbonate of soda, to throw down any iron which may be present. We then drop the supernatant liquid into a quantity of the water of ammonia, taking care not to add so much of the alumino-solution as will saturate the ammonia. The volatile alkali unites with the sulphuric acid of the alum, and the earthy basis of the latter is separated in a white spongy precipitate. This must be thrown on a filter, washed, or edulcorated, as the old chemists expressed it, by repeated affusions of water, and then dried. Or if an alum made with ammonia instead of potash, as is the case with some French alums, can be got, simple ignition dissipates its acid and alkaline constituents, leaving pure alumina.'

Alumina prepared by the first process is white, pulverulent, soft to the touch, adheres to the tongue, forms a smooth paste without grittiness in the mouth, insipid, inodorous, produces no change in vegetable colours, insoluble in water, but mixes with it readily in every proportion,

and retains a small quantity with considerable force; is infusible in the strongest heat of a furnace, experiencing merely a condensation of volume and consequent hardness, but is in small quantities melted by the oxyhydrogen blowpipe. Its specific gravity is 2.000, in the state of powder, but by ignition it is augmented.

Every analogy leads to the belief that alumina contains a peculiar metal, which may be called aluminum. The first evidences obtained of this position are presented in Sir H. Davy's researches. Iron negatively electrified by a very high power, being fused in contact with pure alumina, formed a globule whiter than pure iron, which effervesced slowly in water, becoming covered with a white powder. The solution of this in muriatic acid, decomposed by an alkali, afforded alumina and oxide of iron. By passing potassium in vapour through alumina heated to whiteness, the greatest part of the potassium became converted into potash, which formed a coherent mass with that part of the alumina not decompounded; and in this mass there were numerous grey particles, having the metallic lustre, which became white when heated in the air, and which slowly effervesced in water.—In a similar experiment made by the same illustrious chemist, a strong red heat only being applied to the alumina, a mass was obtained, which took fire spontaneously by exposure to air, and which effervesced violently in water. This mass was probably an alloy of aluminum and potassium. The conversion of potassium into its deutoxide, dry potash, by alumina proves the presence of oxygen in the latter. When regarded as an oxide, Sir H. Davy estimates its oxygen and basis to be to one another as 15 to 33; or as 10 to 22. The prime equivalent of alumina would thus appear to be $1.0 \times 2.2 = 3.2$.

But Berzelius's analysis of sulphate of alumina seems to indicate 2.136 as the quantity of the earth which combines with 5 of the acid. Hence aluminum will come to be represented by $2.136 - 1 = 1.136$. But we shall presently shew that his analysis, both of alum and sulphate of alumina, may be reconciled to Sir H. Davy's equivalent prime = 3.2. That of aluminum will become of course 2.2.

Alumina which has lost its plasticity by ignition, recovers it by being dissolved in an acid or alkaline menstruum, and then precipitated. In this state it is called a hydrate, for when dried in a steam heat it retains much water; and therefore resembles in composition wavellite, a beautiful mineral, consisting almost entirely of alumina, with about twenty-eight per cent. of water. Alumina is widely diffused in nature. It is a constituent of every soil, and of almost every rock. It is the basis of porcelain, pottery, bricks, and crucibles. Its affinity for vegetable colouring matter is made use of in the preparation of lakes, and in the arts of dyeing and calico printing. Native combinations of alumina constitute the fuller's earth, ochres, boles, pipe-clays, &c.

Alvin is manufactured from alum stone, in considerable quantities; the alum known in commerce under the name of Roman Levant or Smyrna alum,

is made at La Tolfa, not far from Civita Vecchia, in the Roman state. The ore forms veins of considerable hardness, which are taken from the rock by blasting. The pieces are carried to the calcining oven, which is merely a hole dug in a rising ground 4 or 5 feet in diameter, and from 5 to 6 in depth, with a side gallery communicating with the open air and the bottom of the furnace; the bottom being covered with pieces of wood, on which the ore is laid so as to form a hollow vault, between the openings of which room is left for the smoke. The fire being kindled, and the flame appearing between the pieces of ore, a workman attends to keep it at a regular heat. In about four hours the smoke decreases, and the fire begins to burn brightly, which it is suffered to continue till a strong smell of burning sulphur arises. The ore is then sufficiently roasted, the fire is put out, and the stones left to cool. If this process has been properly conducted, the ore obtains the sweet astringent taste of alum. The second process is nearly similar to the first mode pursued to obtain sulphate of iron (green vitriol): it begins by piling the calcined stones in long beds on a sloping floor, the lower side of which is terminated with a ditch of water, having a clayey bottom: from this ditch the stones are frequently sprinkled, and the water drains from them again into the reservoir. In about fourteen days the stones begin to crack and break down, and are in about forty days overspread with a reddish efflorescence and reduced to a kind of paste: (perhaps this might be much more speedily effected by breaking down the ore in large mortars, crushing it by mill-stones or by a pavoir's beater, &c.) A leaden boiler is now half filled with water, and, when heated, fresh portions of the prepared ore are continually stirred in till a solution of sufficient strength is procured; the liquor, though yet turbid, is drawn off into another boiler, where it is gently evaporated, and clarifies itself by depositing its earth. Having arrived at the point of crystallization it is transferred by means of a pipe into a square wooden vessel, eight feet high by five feet wide, so constructed as to be readily taken to pieces; after remaining in it a few days, the mother water is poured out to be boiled again with fresh alum ore in the first cauldron. The crystals when dried are then ready for sale. By the burning in the first part of this process the stones are not only rendered porous, as is the case with the lime-stone in burning, but all the inflammable matter is driven away, as in the smelting of lead ore: the sweet aluminous taste is at the same time excited. The subsequent crackling and breaking down, whilst on the inclined plane in the second process, is probably caused by their absorption of moisture.

The alum manufactured from pyritous ores, which, with the foregoing, are the only alums made in Europe, is prepared from aluminous slate or earth; and, as they possess that salt in a very small degree, a more extensive process is necessary for its extraction. This is begun by exposing it to the action of the atmosphere, which reduces it almost into the state of sulphate of iron. As in England and Sweden this article is obtained from a stony substance, a previous

roasting is necessary, which is performed in this manner. A floor is formed of clay beat tight, on which faggots or coals are placed, and set fire to. Upon this the workmen throw, by degrees, small pieces of ore unburnt, till a stratum is formed about six inches thick. These soon take fire by their own bitumen, and are then covered with a stratum of ore, already burnt and lixiviated, of the same thickness; to this succeeds a layer of unburnt ore, and thus they proceed until they form about ten strata. The same care to preserve an equal degree of heat is here to be observed as in the mode practised at La Tolfa, till the bitumen being all consumed the fire ceases of itself. If the ore is now examined it will be found to be of a reddish colour, from the same reasons that in placing the sulphate of iron in a red heat, it obtains and continues that colour, and is then called colcothar. In some Swedish manufactories it is accordingly lixiviated without further preparation. In the alum works of the English and Germans, the roasted ore is lightly watered, but without the precaution used at La Tolfa, of again receiving the liquor. It is likewise exposed for a greater, or less time to the action of the atmosphere, by which the sulphur of the pyrites is more completely oxygenated, and consequently a greater portion of alum obtained. At Flourens in the department of Ourte in France, the excellent practice is observed of lightly roasting the ore after spontaneous efflorescence. The acid being thus excited and united in part to the alumine, the process of lixiviation begins. To effect this more completely the ore is thrown into large reservoirs, either of stone or wood, which have false bottoms, to serve the purpose of filters. Water is then poured on and allowed to remain about 24 hours, in which time the greatest part of the salts are dissolved. Each of these reservoirs are furnished with a pipe, and a cork placed within a few inches of the bottom, (attached in the same manner as they are to the glue-makers' boilers) by this the liquor is run off, after which fresh water is poured on again. This second water is used again for the first lixiviating liquor of another parcel of ore. Both these lixiviations are performed with cold water; but it appears that great improvement, by a saving of time, might be made by boiling it. Should even the fuel increase the expense, yet the frequency of renewal, as in the distillation of whisky, might compensate that. It is now boiled down in leaden boilers with the mother water of a preceding boiling; and the waste of steam is supplied either by adding mother water or fresh liquor. The evaporation lasts from twenty-four to forty-eight hours. In Saxony, where it is concentrated very highly, it is boiled eight days. At the end of these respective periods the strength of the liquor is tried by a leaden hydrometer, or with still greater exactness by filling a bottle of known size and weight with the liquor and then weighing them. When it is sufficiently strong an alkaline solution is added, and the first crystallization is brought about. In the Saxon manufactories, as soon as the evaporation is finished, the contents of a boiler are let out into a reservoir, where they are strongly agitated for half an hour; in which

time a certain proportion of soap-makers' lees and sour urine is added, and the liquor being let into another vat the crystals of alum begin immediately to be deposited. At the end of a few days the mother water is ladled out, and the crystals collected and washed.—In the English works, after examining by the hydrometer, if sufficiently evaporated the fire is taken away, and a stream of impure alkaline lixivium, from kelp and soap-makers' ashes, poured into the boiler; at the same time the cork at the bottom is opened and the liquor run off into a reservoir, by which means a speedy and complete mixture is effected. It remains in this reservoir three hours, when the alkali makes it deposit an earthy and ferruginous sediment, which is the action of clearing it. It is then transferred to another vessel, and again proved, when a greater or less quantity of putrid urine is added, according as it is above the standard; it is briskly stirred for about a quarter of an hour, and then left to rest: in the course of five days the crystals are deposited.—The rough alum is then washed, to free it from the green vitriol, which is deposited with it. It is boiled again, and when boiling, bullock's blood, or other such substance, is thrown in to clear it: when this is effected, the liquor is run into casks, where the crystals are deposited in large masses. After ten or twelve days the mother water is poured out, and the salt, after drying, is ready for sale. The stone itself is found in great quantities in some parts of the Lothians, and in the neighbourhood of the Hunter Works near Paisley; it abounds also in the Isle of Sky, as has been proved from a late survey.

The most extensive alum manufactory in Great Britain is at Hurlett, near Paisley. The next at Whitby; of the state and processes of which an instructive account was published by Mr. Winter in Nicholson's Journal. The stratum of aluminous schistus is said to be twenty-nine miles in width, covered by strata of alluvial soil, sandstone, ironstone, shell, clay, &c. The alum schist is generally disposed in horizontal laminae. The upper part of the rock is so abundant in sulphur, that a cubic yard taken from the top of the stratum is of five times more value than the same bulk 100 feet below.

If a quantity of the schistus be laid in a heap, and moistened with sea-water, it will spontaneously take fire, and continue to burn till the inflammable matter be consumed. The rock, however, is commonly broken into small pieces, and laid on a horizontal bed of fuel, composed of brushwood and such like materials. When about four feet in height of the rock is piled on, fire is set to the bottom, and fresh rock continually augmented upon the pile, until the calcined heap be raised to the height of ninety or one hundred feet. Its horizontal area also, at the same time, progressively extended, till it forms a great bed nearly 200 feet square, having about 100,000 yards of solid measurement. The rapidity of the combustion is allayed by plastering up the crevices with moistened schist.

The calcined mineral is digested in water, in pits of about sixty cubic yards. The liquid is drawn off into cisterns, and afterwards pumped again upon fresh calcined minerals; this is re-

peated until the specific gravity becomes 1.15. The half-exhausted schist is then covered with water to take up the whole soluble matter, and the strong liquor drawn off into settling cisterns, where the sulphate of lime, iron, and earth are deposited; and where the liquid is boiled its purification is accelerated. It is then run into leaden pans ten feet long, four feet nine inches wide, two feet two inches deep at the one end, and two feet eight inches at the other. Here the liquor is concentrated at a boiling heat. Every morning the pans are emptied into a settling cistern, and a solution of muriate of potash, either pure from the manufacturer, or crude and compound from the soap-boiler, is superadded. The quantity of muriate necessary is regulated for the workmen by the hydrometer. By this addition the pan-liquor, which had acquired a specific gravity of 1.4 or 1.5, is reduced to 1.35, and, after being allowed to settle for two hours, is run off into the coolers to be crystallized. At a greater specific gravity than 1.35, the liquor, instead of crystallizing, would, on cooling, present us with a solid magma, resembling grease. Urine is added occasionally to bring it to the proper density.

After standing four days, the mother-waters are drained off, to be pumped into the pans on the succeeding day, and the crystals of alum washed in a tub and drained. They are then put into a lead pan, with as much water as will make a saturated solution at the boiling point. When the solution is run off into casks, which at the end of ten or sixteen days are unhooped and taken asunder, the alum is found exteriorly in a solid cake; but in the interior cavity in large pyramidal crystals, consisting of octahedrons successively inserted into one another. This last process is called roching.

Alum is extremely useful in the art of dyeing; as by means of it a great number of colours are fixed and rendered permanent upon cloth, which otherwise would either not adhere in any degree, or only for a very short time. In what manner this is accomplished we are ignorant. See the conjectures and theories on this subject under DYEING. It constitutes the basis of crayons, which generally consist of the earth of alum finely powdered and tinged for the purpose. In the preparation of Prussian blue, it prevents the basis of martial vitriol, which is soluble in acids, from being precipitated by the superfluous alkali employed in the preparation of that pigment; that is, the alkali which is not saturated by the colouring matter. As this basis adheres more strongly than the clay to the vitriolic acid, and would form a green by the mixture of its yellowness, the white earth of alum likewise, according to its quantity, dilutes the darker colours, even black itself, and produces an infinite number of shades.

ALUM, in medicine, is of considerable use as an astringent and tonic. It is reckoned particularly serviceable for restraining haemorrhages, and immoderate secretions from the blood; but less proper in intestinal fluxes. In violent haemorrhages it may be given in doses of fifteen or twenty grains, and repeated every hour or half hour till the bleeding abates: in other cases, smaller doses are more adviseable, large ones

being apt to nauseate the stomach, and occasion violent constipation of the bowels. It is used also externally, in astringent and repellent lotions and collyria. Burnt alum taken internally has been highly extolled in cases of choleric. In such instances, when taken to the extent of a scruple for a dose, it has been said gently to move the belly, and give very great relief from the severe pain. Its officinal preparations are, for external use, pulvis stypticus, and aqua styptica; for internal applications, the aqua aluminis, and coagulum aluminis and alumen ustum; which last is no other than the alum dried by fire, or freed from the watery moisture, which, like other salts, it always retains in its crystalline form. By this loss of its water it becomes sharper, so as to act as a slight escharotic; and it is chiefly with this intention that it is employed in medicine, being very rarely taken internally.

Alum is used in large quantities in various manufactorys. When added to tallow, it renders it harder. Printers' cushions, and the blocks used in the calico manufactory, are rubbed with burned alum to remove any greasiness, which might prevent the ink or colour from sticking. Wood sufficiently soaked in a solution of alum does not easily take fire, and the same is true of paper impregnated with it; which for that reason is very properly employed in preserving gunpowder, as it also excludes the moisture of the air. Paper impregnated with alum is used in whitening silver, and silvering brass without heat. Alum is also of use in tanning, which it assists in restoring the cohesion of the skins almost entirely destroyed by lime. Vintners fine down their wines, &c. with alum; fishers use it to dry cod-fish with; and bakers have mixed it with the flour to make their bread compact and white; to this last use of it great objections have been made, but unjustly, for it is entirely innocent. Alum mixed in milk helps the separation of butter; and if added in a very small quantity to turbid water, renders it perfectly limpid, without any bad taste or quality; while the sulphuric acid imparts to it a sensible acidity, and does not precipitate so soon, or so well, the opaque earthy mixtures.

Brunswick alum was made to imitate the rock alum. Now as this last is often used in medicine, and frequently the first, which contains arsenic, is mistaken for it, an easy method, therefore of detecting the counterfeit may be useful to society: the external appearance differs but little; the taste of the Brunswick is less styptic; it is not so soluble in water, and when heated to redness, loses only 39.5 per cent. of its first weight, whilst the rock loses one half. When this last is exposed to the blow-pipe, it becomes opaque, swells, foams, and is converted to a white spongy mass. The Brunswick swells less, foams very little, but melts, and becomes of a greenish colour, exhaling an arsenical vapour. The rock alum being precipitated by potash or soda, and mixed with borax, fuses before the blow-pipe into a white or yellowish white: the Brunswick gives a violet coloured globule; and, in fact, it is nothing but common alum with a small proportion of arsenic and cobalt.

ALUMGURNAGHUR, the Mahomedan name of Beyhar, a city of Bengal, and of a for-

tress which stood formerly on the banks of the Megna.

ALUMINITE is a mineral of a snow-white colour, dull, opaque, and having a fine earthy fracture, found chiefly in the alluvial strata round Halle, in Saxony. It has a glistening streak; found in kidney-shaped pieces, which are soft to the touch, and adhere slightly to the tongue. Specific Gravity, 1.67.

It consists of sulphuric acid . . .	19.25
Alumina, . . .	32.50
Water . . .	47.00
Silica, lime, and oxide of iron . . .	1.25
	100.00

ALUMTA, in botany, a name given by the old Latin writers to the lutum and corniola, by the Greeks called cymene. It was the same with our genistella tinctoria, or dyers' weed, and was used by the ladies to tinge their hair yellow, the colour that was then esteemed beautiful.

ALUNGU, in natural history, the name given by the Malabarians to a species of the manis of Linnæus, and belonging to the family of ant-eaters, which have no teeth but a long round tongue with which they take ants.

ALUNKAN, or **AR**, in geography, a town of Prussia, province of Zabulistan, 100 miles south of har.

ALUNTUM, **ALONTIUM**, in ancient geography, a town in the north of Sicily, situated on a steep eminence at the mouth of the Clydas; said to be as old as the war of Troy. It is now in ruins; from which arose the hamlet St. Filadelfo, in the Val di Demona.

ALVOR, in geography, a small place with an earldom in the province of Algarve, between Villa Nova de Portimao and Lagos.

ALVOREDO, an island of South America, on the coast of Paraguay, three leagues south of St. Catharine's island. S. lat. 27°. 43'. W. long. 49°. 16'.

ALVORNINHA, or **ALBURNINHA**, a small town of Portugal, in Estremadura, containing about 1500 inhabitants.

ALURNUS, in entomology, a genus of insects of the order coleoptera, with filiform antennæ, six very short palpi or feelers, and horny arched maxilla or jaw. There are three species, viz. 1. A. grossus, black, with crimson thorax and yellow elytra, found in South America and India. 2. A. femoratus, of a green-reddish colour, with the hinder thighs and legs dentated, the tenebrio femoratus of Drury, and the tenebrio viridis of Sultzer, found in India, with the antennæ half the length of the body, and the last joints black. 3. A. dentipes, black, with the hinder thighs and legs dentated, and found at the Cape of Good Hope.

ALUSAR, in chemistry, manna.

ALUSII. See **ALLUSII**.

ALUSHIMA CARAMANICA, in botany, a plant growing in Caramania, and a preparation of that plant or pigment made from it. It occurs often in the writings of Avicenna and Serapion.

ALUTA, in medicine, soft, thin, leather, used for plasters.

ALVUS, in anatomy, a term used for the belly

in general, but very frequently applied to the bowels.

ALVUS ADSTRICTA, a costive state of the belly.

ALVUS LIQUIDA, a laxative state of the viscera.

ALWAYS, *adv.* All ways, or al-way. Alla waega.—Ital. *tutta vai*. Constantly, perpetually; under all circumstances or conditions.

That, which sometimes is expedient, doth not always so continue. *Hooker.*

Man never is, but *always* to be blest. *Pope.*

For every trifte scorn to take offence,

That *always* shows great pride, or little sense;

Good nature and good sense should ever join.

To err is human, to forgive divine. *Id.*

He is *always* great, when some great occasion is presented to him. *Dryden.*

ALYGHEN. See **ALLIGHEN**.

ALYPIAS, or **ALYON**, in the *materia medica*, a species of turbith, prescribed by some physicians for the purging of bile, grows in several parts of France, particularly in Provence and Languedoc. It is a kind of senna.

ALYPIUS, a platonic philosopher of Alexandria, in the fifth century, remarkably small in stature, but of a strong mind, and one of the best dialecticians of his time.

ALYPIUS, an architect and geographer of Antioch, employed by Julian, in his attempt to rebuild the temple of Jerusalem. At the close of life he was charged with magical practices, and banished. His geographical description of the world was printed at Geneva in 1623.

ALYPIUS, bishop of Tagasta, in Africa, the friend of St. Augustine, was baptized with him at Milan in 388. He opposed the Donatists and Pelagians with great zeal, and died in 430.

ALYPUM, in botany, a name given by some authors to a species of spurge, the tithymalus amygdaloïdes angustifolius, or narrow-leaved almond spurge of Tournefort. Alypum is likewise a name given by some authors to a species of dog's-bane, the purple flowered sea apocynum of Venice, with willow-like leaves. Alypum is applied also to the globularia of Linnaeus.

ALYPUM, in medicine *αλυπον*, a word used by Galen, for a minorative, or opening medicine.

ALYSSUM, **ALLYSON**, or **ALLYSOIDES**, madwort; from *αλυσσω*, to be mad; because it was believed to have the property of curing madness. A genus of the siliculosæ, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, siliquosa. CHAR. are: calyx, an oblong four-leaved perianthium : COR. four cruciform petals; with claws the length of the calyx, the petals shorter : STAM. consists of six filaments the length of the calyx, two of them rather shorter and denticulated : ANTH. are erect and expanding : PIST. an ovate germin : STY. simple, and the length of stamina : STIG. obtuse : PER. a sub-globular emarginated silicle, furnished with a bilocular stylus, having an elliptic partition: the seeds few, orbicular, and fixed to filiform receptacles. Of this genus, Linnaeus enumerates 19 species; but none of them are remarkable except the following:—A. halimfiolum, or madwort, with whole spear-shaped leaves. It is not now used in medicine.

ALYTARCHIA, a priest of Antioch in Syria, who, in the games instituted in honour of the

gods, presided over the officers who carried rods to clear away the crowd and keep order. In the Olympic games, the alyarchs had the same command, and obliged every person to preserve order and decency.

ALYTHI, a parish in Perthshire, on the north side of Strathmore; about twelve miles long, and three broad, (at an average); stretching from south to north towards the Grampians. It is watered by the Isla, the Ericht, and the Alyth; and the low ground of it is extremely fertile, producing excellent crops of barley, oats, and wheat; with grass, turnips, potatoes, &c. Also Alyth, a rivulet of Perthshire, which rises in the upper part of the parish.

ALYTIN, a village in Perthshire, which was erected into a burgh or barony by king James III. and contained 2000 inhabitants. The principal manufactures are yarn and brown linens.

ALZACHI, in the *Materia Medica*, the name given, by the Arabian physicians, to that kind of gourd called citrul, and by the Italians anguria. It is an oblong, and usually crooked gourd, containing in its cavity a considerable quantity of water. Its seeds are oblong, flattened and covered with a hard skin.

ALZAGIAT, or **AEZEGE**, a name given by the Arabian writers to all the vitriolic minerals.

ALZARAC, a kind of coarse camphor, of a brown colour; the same with our rough camphor as imported from the Indies.

ALZEMAFOR, in chemistry, 'cinnabar.'

ALZILAT, in medicine, a weight of three grains.

ALZOFAR, in chemistry, burnt copper.

ALZUM, or **ALDUM**, in botany, a name given by the ancients to the tree which produces the gum bdellium, called by the Arabians mokel.

AM. The first person, present tense, indicative mood, of the verb *to be*. It is remarkable that the verb corresponding to this, is irregular and auxiliary in many languages. The Gothic, Saxon, and German tongues, are those from which the principal forms in English are derived. Gothic, *Ik im, thei is, is est, Wus syum, Ik Was, Wus, wesum*, are the archetypes of our present imperfect tenses.—To similar originals we may refer the remaining forms, for which, see the grammars of the above-named languages, and their northern affinities.

What? do I feare my selfe? There's none else by,
Richard loues Richard, that is, I am I,
Is there a murtherer heere? No; yes, I am.

Shakespeare's King Richard III.

SES. Thou bors't the face once of a noble gentleeman,

Rankt in the first file of the virtuous,
By every hopeful spirit.

Tell me, Virolet,

If shame have not forsook thee, with thy credit.

VIR. No more of these racks; what I am, I am.
Beau. and Fletch. Double Marriage, act iii.

And God said unto Moses, I am that I am: and he said, Thus shalt thou say unto the children of Israel, I am hath sent me unto you. *Exodus* iii. 14.

Come then, my soul: I call thee by that name,
Thou busy thing, from whence I know I am:
For knowing that I am, I know thou art;
Since that must needs exist, which can impart.

Prior.

'I am better than thou,' raises the furious and bloody contestations for precedence: 'I am holier than thou,' causes a contemptuous separation from company perhaps better than ourselves: 'I am wiser than thou,' is guilty of all the irregular opinions that the world is disquieted withal.

Bp. Hall's Peace Maker.

AM, in geography, supposed to be the present Am, a famous city of Armenia, where they formerly reckoned 100,000 houses, and about 1000 mosques. It was taken by the Tartars in 1219, and is now considerably reduced.

AMA, **AME**, or rather **AMES**, *aηγη*, in medicine, a sort of cake. Aretaeus used this word, to express the quantity of hellebore which is sufficient for a dose in strong constitutions, when given in a vertigo.

AMA, **AMULA**, or **HAMA**, in ecclesiastical writers, a vessel wherein wine, water, or the like were held, for the service of the eucharist.

AMA in commerce, a wine measure, a cask, pipe, or the like.

AMABYR, in ancient customs, a price paid to the lord of the manor on marrying a virgin of his tenantry. 'Pratum virginitatis domino solvendum.' It once prevailed in many parts of England and Wales, and so late as the 3d of Philip and Mary we find Henry, earl of Arundel, releasing to his tenants this right.

AMACHURA, a river of the province of Cumana, in South America, which empties itself northward in the principal mouth of the Orinoco.

AMACK, or **AMAK**, a small island of the Baltic, joined to Copenhagen, on the south, by two bridges, was colonized originally from East Friesland, by Christian II. in 1516, for the purpose of supplying the inhabitants of the capital of Denmark, with butter, cheese, and herbs, and is to this day principally appropriated to the same purpose. The inhabitants preserve much of their original dress and manners, which are said to resemble those of the society called Friends; and, indeed, their particular privileges, courts of judicature, &c. tend to preserve these distinctions, although intermarriages are constantly taking place between them and their neighbours. The island is about four miles long, and two broad; has some quarries for lime, and stone for building; and contains about 3,500 souls, who are distributed among six different villages. A portion of this capital, called Christian's haven, (from its being principally built by Christian IV.) is erected upon the shore of this island. The inlet between Amack and the main land, from the harbour of **COPENHAGEN**, which see.

AMACORE, a large river of South America, in the province of Guiana, which descends from the western Cordillera, and, running eastward, bordered by beautiful trees, after being joined by several other rivers, falls into the Atlantic Ocean.

AMACUSIA, a city and province of Japan, near the island of Ximo.

AMADABAT, a corruption from **AHMED ABAD**, or **AHMED**'s city.

AMADAN, or **HAMADAN**. See **HAMADAN**.

AMADANAGER, or **ANDANAGER**. See **AHMEDNUGGAR**.

AMADEUS V. count of Savoy, succeeded to the sovereignty, in 1282, and obtained the sur-

name of ‘the great.’ His possessions were much enlarged by marriage, purchase, and donation. In defending Rhodes against the Turks, in 1311, he gained distinguished honour; and, in memory of this service, he and his successors took for their device, F. E. R. T. the initials of the Latin words, ‘Fortitudo ejus Rhodum tenet,’ i.e. ‘His valour preserved Rhodes.’ The grand master of the knights of St. John, to whom Rhodes belonged, granted him a palace at Lyons as a reward of his effectual succour. He died, after a reign of 38 years, in 1323, at Avignon, where he was soliciting pope John XXII. to publish a crusade in favour of Andronicus, emperor of the East, who had married his daughter. He was much loved and honoured by all the sovereigns of Europe, and was generally the mediator in their differences. *Mod. Univ. Hist.* vol. xxxiv. p. 16.

AMADEUS VIII. count of Savoy, succeeded his father, Amadeus VII. in 1391, and acquired the titles of the ‘Pacific,’ and ‘the Solomon of the age.’ In 1416 Savoy was erected by the emperor into a duchy; but, after this elevation, Amadeus formed the resolution of retiring from his throne and family, into a religious house, at a place called Ripaille. In a retreat, which he had sought, according to the opinion of the world, from religious motives, he devoted himself to every kind of pleasure and luxury, so that faire repailles, became proverbial to signify a life of exquisite gratification and indulgence. Here he instituted the order of St. Maurice, or the Annunciatæ, consisting of a number of hermits, who excluded women from their community, but in other respects maintained the character of Epicureans, and votaries of pleasure. Here also Amadeus aspired to the papacy, and employed large sums of money at the council of Basil, to secure the object of his ambition. Accordingly, in 1439, this council having deposed pope Eugenius IV. conferred the triple crown on Amadeus (though he had never taken holy orders), under the name of Felix V. A schism was the consequence of this extraordinary election; and Eugenius at length excommunicated his rival. On his death, Amadeus was persuaded to abdicate, and a new pope was chosen in his room. His resignation was amply recompensed, by the dignities of cardinal, bishop, and apostolical legate, and by his being allowed to retain most of the pontifical insignia. He died, at the age of 69, in 1451, at Lausanne. *Mod. Univ. Hist.* vol. xxxiv. p. 78.

AMADEUS IX. count of Savoy, was surnamed the ‘happy,’ on account of his virtue and piety. He succeeded Lewis, in 1464; and, though his bodily infirmities prevented his engaging in any great exploits, acquired and maintained a very exemplary character. He was eminently distinguished by the benevolence of his disposition. Being once asked by a courtier, ‘whether he kept hounds?’ he pointed to a great number of poor people, who were seated at tables, eating and drinking, and replied, ‘those are my hounds, with whom I go in chase of heaven.’ When told that his alms would exhaust his revenues: ‘Take the collar of my order,’ he said, ‘sell it, and relieve my people.’ He married Isolande of

France, who concurred with him in all his good deeds. His death, in 1472, at the age of 37, and after a reign of seven years, was universally regretted. *Mod. Univ. Hist.* vol. xxxiv. p. 83.

AMADIA, an important town and fortress of Kurdistan, in Asia, on a lofty mountain, at the base of which is a plain covered with dependent villages. Its prince, or governor, is descended from the caliphs of Bagdad. Only one ascent, by a narrow flight of steps, cut out of the rock, leads up from below. The town, which has considerable trade, is 72 miles north of Mouel.

AMADOU, in natural history, is a variety of the boletus ignarius, found on old ash and other trees. When boiled in water to extract its soluble parts, and beaten with a mallet to loosen its texture, it has the appearance of very spongy doe-skin leather. It is now impregnated with a solution of nitre, and dried, when it is called spunk, or German tinder; and is a substance much used on the continent for lighting fires.

AMAGUANA, a town and river of South America, in Quito. The river rises on the west side of the Andes, in the desert of Ilinissa, and after running northward, joins the Esmeralda, near St. Antonio, and falls into the Pacific. The town is 10 miles south of Quito.

AMAIN, *adv.* Ang. Sax. *Magan*, to possess power or might; past participle *Magen*, might, with all might. Power, strength.

When stars doe counsell rest
Incroching cares renue my grieve as faste,
And thus desired night in wo I waste:
And to expresse the harts excessive paine,
Mine eies their deawie teares distill *amaine*.

Turberville.

Great lords, from Ireland am I come *amain*,
To signify that rebels there are up. *Shaksp.*
What! when we fled *amain*, pursued, and struck
With heaven's afflictiong thunder, and besought
The deep to shelter us? *Milton.*

The hills, to their supply,
Vapour and exhalation, dusk and moist,
Sent up *amain*. *Id.*

From hence the boar was rous'd, and sprung *amain*,
Like light'ning sudden, on the warriour train,
Beats down the trees before him, shakes the ground;
The forest echoes to the crackling sound,
Shout the fierce youth, and clamours ring around. *Dryden.*

From step to step the rolling ruin bounds:
At every shock the crackling wood resounds;
Still gath'ring force, it smokes and urg'd *amain*,
Whirls, leaps, and thunders down impetuous to the
plain. *Pope's Iliad*, xiii. 197.

AMAIN, or AMAYNE, in sea language, a term importing to lower something, either at once, or by degrees. Thus, to strike *amain*, is to lower, or let fall the top-sails; to wave *amain*, is to make a signal, by waving a drawn sword, or the like, as a demand that the enemy strike their top-sails; which is done either in the fore-top, or on the poop.

AMAISTRE, *v.* To master. See MASTER.

Plato had a cause his seruaunt to scourge, and yet cleaped he his neighbour, to perfourme the doing, himselfe would not, least wrath had him *amaistred*, and so might he haue laid on too much.

Chaucer. Tese of Loue, fol. 305. c. iv.

Is he not rich that hath suffisance, and half ye
power that no man may *amaistren*. *Id.* fol. 305. c. ii.

AMAK, or **ABULNAGIE AL BOKHARI**, a celebrated poet of Persia. His principal production is a poetical History of the Loves of Joseph and Zoleiskah. He was the first president of the academy of poets, instituted in the fifth century, by Khedar Khan. He lived to an advanced age.

AMALAGANOR, or **ISLAND OF CONCEPTION**, one of the Ladrone isles, about six miles in circuit, and three and a half from Gugman. Long. $128^{\circ} 14' E.$ lat. $18^{\circ} 16' N.$

AMALARIC, or **AMAURY**, king of the Visigoths, was the son of Alaric II.; but being an infant of five years, at his father's death, in 506, the throne was usurped by Gensaliac, the natural son of Alaric. Amalaric, in the meanwhile, was taken into Spain; and his grandfather, Theodoric, king of the Ostrogoths, having expelled Gensaliac from the throne, reigned over the Visigoths also, till his death, in 526, when Amalaric assumed the government. This prince was zealously attached to the Arian doctrine and cause, and as he had married Clotilda, the daughter of Clovis, who inherited the piety and orthodoxy of her mother, he used various means, and as the Catholic historians say, those of violence, to proselyte her to his own opinion. In consequence of her complaints, her brother, Chilperic, king of France, marched with a numerous army into the territories of Amalaric, defeated him in an engagement, and forced him to take refuge on board his fleet. But recollecting that his treasures were left in the city of Narbonne, Amalaric went on shore, where he was surprised by the enemy; and seeking safety in a church belonging to the Catholics, a common soldier ran him through with a spear, A. D. 531. Some say that he retired to Barcelona, and was assassinated by his own subjects. *Mod. Univ. Hist.* vol. xvi.

AMALASONTHA, regent and queen of Italy, was the daughter of Theodoric the Great, king of the Ostrogoths, by Audefleda, the sister of Clovis, and united in her person the two most illustrious families of the barbarians. She was born about the year 498, and in 515 was married to Eutharic, the last heir of the royal race of the Amali, whom her father had sent from Spain, and designed for his successor, as the sex of his daughter excluded her from the Gothic throne. Eutharic soon died, and left an infant son, Athalaric; when Amalasontha assumed the guardianship of her son, and of the kingdom of Italy. His death, at the age of 16, in consequence of intemperance, left her destitute of any firm support, or legal authority; she now conceived the design of sharing with one of her cousins, the regal title. The eloquent Cassiodrhus announced to the senate and to the emperor, that Amalasontha and Theodatus, had ascended the throne of Italy. But the issue of this scheme of ambition soon proved fatal. Instigated by the principal Goths, Theodatus caused the queen to be imprisoned in a small island, in the lake of Bolsena, where she was strangled in the bath, A. D. 535. *Gibbon's Hist.* vol. vii.

AMALEK, פָלָק, Heb. i. e. a sucking people, the son of Eliphaz, by his concubine, Timna, and grandson of Esau. He was the 7th

ruler of Edom, and the successor of Gatam in the government of the Edomites; unless, as is probable, all the seven rulers, mentioned Gen. xxxvi. 15, 16, were cotemporary. Some authors suppose him to have been the progenitor of the Amalekites; but this is improbable. See the article **AMALEKITES**.

AMALEK, the son of Ham, and grandson of Noah, according to the Arabians, the progenitor of the Amalekites, and the father of Ad, a celebrated Arabian prince, the head of the Arabian tribe, called Adites, and the grandfather of Schebad and Schedid. See next article.

AMALEKITES, a people of Arabia, long ago exterminated. Some authors trace their origin from Amalek, ruler of Edom, and pretend to account for their early antipathy to the Israelites, from their revenge for Jacob's having deprived Esau of his birth-right; but these writers seem to forget that Moses mentions the Amalekites as a distinct nation in the time of Abraham, Gen. iv. 7; and expressly says, that their country was ravaged by the four combined kings, Amraphel, Arioch, Chedorlaomer, and Tidal, at least 200 years before the birth of Amalek the Edomite. Balaam, too, in his prophecy, Numb. xxiv. 20, styles them the first of nations. We rather adopt the opinion of the Arabians, who trace their descent from son of Ham, see last article. The earliest account we have of this nation, after the depredations committed upon them by Chedorlaomer and his allies, A. M. 2091, is their provoked and cowardly attack upon the Israelites, after their arrival in the wilderness, when they assaulted those who, through weakness or fatigue, were unable to keep pace with their brethren; an act of inhumanity for which the Israelites were expressly commanded to extirpate the nation. See Deut. xxv. 17; Exod. xvii. 8—14; Judges iii. 13, &c.

AMALFI, an ancient city of Italy, situated on the bay of Salerno, ten miles west from that city, and thirty from Naples. It is said to have derived its origin from a number of Roman families, who, about the middle of the fourth century, left Rome and embarked for Constantinople; but meeting with storms on their passage, were thrown on the shores of Salerno, where they founded a flourishing republic. Impervious mountains and inaccessible coasts preserved their infant state from the first fury of the Lombards, who seldom attempted the conquest of a maritime people; and in 825, it attained considerable rank and importance under the patronage of the eastern emperors. Sico, prince of Salerno, marched a body of troops by night; surprised Amalfi; and, carrying off the greatest part of the inhabitants, compelled them to fix at his own capital, which had lately suffered a great loss of people by an epidemical disorder. But before the fifth year of their captivity was expired, the Amalfitans took advantage of the absence of the Salernian chiefs, who were then carrying on a war with the Beneventans; armed themselves; and, after burning and plundering Salerno, marched in triumph back to their own country. On their return, their first plan was to vest the supreme authority in a temporary prefect; but afterwards they placed that power in the hands of

a duke elected for life, whose office was hereditary in the family of Piccolomini. Under these governors Amalfi attained the summit of her glory; and extended her territory eastward from Vico Vecchio, to the promontory of Mervia westward, including likewise the island of Caprea, and the two islands of the Galli. Towards the north it comprehended the cities of Lettere, Gragnans, Pimontio, and Capule di Franchi; towards the south those of Scala, Ravelli, Minor, Majori, Atrani, Tramonti, Agerula, Citara, Prajano, and Rosilano. Leo IV. found the Amalfitan useful allies in his wars with the infidels, and honoured the commonwealth with the title of Defender of the Faith. The Neapolitans experienced many signal favours from them; and even the Mussulmans found it expedient to court their alliance. A court was established at Amalfi for the decision of all controversies arising in maritime transactions; and its code and reports became the general rule throughout this part of Europe. To crown the glory of the republic, it was reserved to the lot of an Amalfitan to make, or at least to perfect, the most important discovery for the improvement of navigation. Pasitan, a village which stands on the shore a few miles west of Amalfi, boasts of having given birth to *Felice Bembo*, the inventor of the mariner's compass. The Amalfitan merchants long engrossed the trade of the Levant. The Pisans, Venetians, and Genoese, rose upon their ruin; and made way for the more comprehensive and daring spirit of the present maritime powers. At present Amalfi is subject to Naples, and is the see of an archbishop. It is but a shadow of what it was in its flourishing state, when it extended over the stupendous rocks that hang on each side, still crowned with remains of battlements, fortified walls, and ruined towers. Its buildings, Mr. Swinburne says, are not remarkable for elegance or size; and contain at most 4000 inhabitants. The cathedral is an uncouth building. Under the choir is the chapel and tomb of the apostle St. Andrew; to whose honour the edifice was dedicated, when Cardinal Capuano, in 1208, brought his relics from Constantinople. Long. 15°. 20'. E. lat. 40°. 35'. N.

AMALFIANS, or **AMALFITANS**, the inhabitants of Amalfi. See their history in last article.

AMAL'GAME, v. } Fr. *Amalgame*; generally deduced from the
AMAL'GAM, n. } *amalga*, together, &
AMAL'GAMATE, } Gr. *αρά*, together, &
AMALGAMATION. } *γαμεω*, to unite. To unite together; to incorporate.

Amalgamation is the mixing of mercury with any of the metals. The manner is thus in gold, the rest are answerable: Take six parts of mercury, mix them hot in a crucible, and pour them to one part of gold made red hot in another crucible; stir these well, that they may incorporate; then cast the mass into cold water, and wash it. *Bacon.*

The metaphysical and alchemical legislators, have attempted to confound all sorts of citizens, as well as they could, into one homogeneous mass; and then they divided this, their *amalgama*, into a number of incoherent republics.

Burke, on the French Revolution.

AMALGAM, in chemistry, from the Greek *αρά*, together, and *γαμεω*, to join: mercury united

with a metal. The amalgam of mercury with lead, is a soft, friable substance, of a silver colour. By washing and grinding this amalgam with warm water in a glass mortar, the impurities of the metal will mix with the water; and by changing the water, and repeating the lotion again and again, the metal will be farther and farther purified.—Boerhaave mentions it as one of the greatest secrets in chemistry, to bring off the liquor as clear as when first poured on the amalgam; which, he says, might afford a method of making the nobler metals, or procuring them from the baser metals. This philosophical way of purifying metals may be easily applied to all metals, except iron and copper. The amalgams of gold, silver, tin, lead, zinc, bismuth, and copper, with quicksilver, are all white; and when the quantity of metal is large in proportion to that of the mercury they thicken into a kind of paste. All metals, except iron and copper, spontaneously unite and amalgamate with mercury; but gold with the greatest facility; silver the next; then lead and tin; copper and regulus of antimony with difficulty; iron and cobalt, scarce at all; but with all other metals and semi-metals, mercury may easily be amalgamated.

For the combination of one metal with another, it is generally sufficient that one of them be in a state of fluidity. Mercury, being always fluid, is capable of amalgamation with other metals without heat, although heat considerably facilitates the operation. To amalgamate without heat requires nothing more than rubbing the two metals together in a mortar; but the metal to be united with the mercury should be previously divided into very thin plates or grains. When heat is used, which is always most effectual, and in some cases indispensably necessary, the mercury should be heated till it begins to smoke, and the grains of metal made red hot before they are thrown into it.

The amalgamation of **COPPER** is a very difficult process, mercury not mixing well with that metal, unless when in fusion, and the heat sufficient to keep it in that state being great enough to evaporate the mercury. Trituration, however, may be made to supply the place of heat, first reducing the copper to an exceedingly fine powder. This amalgam boiled in river water, then distilled in a retort, and cohabited twice, leaves the copper in form of a new metal, of the colour of gold, and more ductile than before. Amalgamations of copper may likewise be performed by dissolving the metal in aquafortis, diluting the solution with twelve times the quantity of pure water, then beating and putting into it polished plates of iron; by this means the copper will be precipitated to the bottom, and the iron dissolved. Pour off the liquor, and wash the precipitate with hot water, till it becomes insipid. The powder being well dried, and put into a glass mortar, with an equal quantity of hot mercury, an amalgam will be made.

Amalgamation of **GOLD** is usually performed by heating the plates of that metal red hot; after which, quicksilver, gently heated, is to be poured upon them, and the mixture stirred with a small iron rod, till it begins to rise in a smoke. It is then thrown into a vessel full of water, when it

coagulates, and becomes manageable. This amalgam is of great use among goldsmiths and gilders. Being laid on any other metal, and afterwards placed on a small fire to evaporate, the gold will be left on the surface of the copper, which makes what we call gilding.—The blackness adhering to the amalgam may be washed away with water; and a great part of the mercury may be pressed out through a linen cloth; and the rest being evaporated in a crucible, by a gentle and gradual heat, the gold remains behind in an impalpable powder, which admits better of being burnished, than that which is procured by grinding of gold-leaf. Gold retains about thrice its own weight of mercury. The gold-dust, or filings, as well as those of silver, dispersed through the sweepings of the goldsmiths' shops, which would otherwise be lost, are recovered by amalgamation with mercury, after washing and trituration.

Amalgamation of IRON has been reckoned extremely difficult, if not absolutely impossible. However, Mr. Navier succeeded in combining mercury with iron by the following process:—Having made strong solutions of iron and of mercury separately in distilled vinegar, he put equal quantities of each into a mattress, which he placed in balneo marie. As soon as the liquor became very hot, there began to be formed on its surface, and within it, an extremely light, fine, white substance, resembling snow, which evidently contained mercury and iron, in a saline form, intimately united with each other. The liquor being filtered left behind this snowy substance, which, when washed and dried, appeared to be a silvery mass, made by the union of innumerable crystals in the form of thin plates, without acidity or acrimony.

Amalgamation of LEAD is thus performed.—Melt a proper quantity of pure lead in an iron crucible; remove the vessel from the fire, and when the metal is a little cooled, add to it an equal weight of clean mercury, which will immediately enter the lead with a hissing noise. Stir the mixture well together with an iron rod, and when cold it will appear in the form of a softish brittle mass.—Bismuth promotes the action of mercury upon lead in a remarkable manner. Mercury impregnated with one-fourth, one-eighth, or one-twelfth its weight of bismuth, dissolves masses of lead, in a gentle warmth, without the agitation, triture, comminution, or melting heat, necessary for uniting lead with pure mercury.

Amalgamation of PLATINA. Dr. Lewis rubbed together one ounce of platina with six ounces of pure quicksilver, together with a little common salt and water, and a few drops of spirit of salt in an iron mortar. After the grinding had been continued for about six hours, the grains of platina appeared to be coated with the quicksilver, so as to cohere together into a kind of imperfect amalgam. After repeating the experiment several times, and evaporating the mixture, he always found, on examining the dark coloured powder, intermingled with shining particles which remained, that a part of the platina was dissolved by the mercury, and that the undissolved grains were coated with it.

Amalgamation of SILVER is performed in the same manner with that of gold; or it may be previously dissolved in aqua fortis, and precipitated. Mr. Gellert observes concerning this amalgam, that its specific gravity is not only greater than the intermediate specific gravity of the mercury and of the silver, but that it is even greater than the specific gravity of mercury, although silver is much lighter. This amalgam is used in the operation of silvering; and also in making the Arbor Dianæ, or the philosophical tree.

Amalgamation of TIN is made in the same way with that of lead. It is used for tinning looking-glasses, and for making mercury balls used in purifying water. Mr. Canton first observed that a small quantity of this amalgam, with a little chalk, being rubbed on the cushion of a glass globe, or on the oiled silk rubber of a tube, would contribute to increase the power of electricity.

Perhaps the most important amalgams are those of gold and silver, and the simplest mode of preparing them is, by taking advantage of the natural affinity, and trusting the combination to the fluidity of the mercury alone. Thus, leaf-gold, by simple trituration, will form with mercury an amalgam in a few minutes; and pieces of gold, silver, or tin, even of considerable thickness, will, without trituration, be dissolved in a few days. The crystalline form of amalgams, owing to their soft or semi-fluid state, at a moderate temperature, distinguishes them from the pure metals. Any metal, melted and cooled very slowly, will exhibit in its fracture a crystalline structure, the crystals of which, by particular management, may be exhibited in a state of separation from each other. Similar appearances may, however, be produced with much greater ease in amalgams. All amalgams are brittle, and any of them, being broken, will exhibit a granular or laminated texture, which, by the microscope, will be found to be owing to a multitude of minute crystals, applied by their surfaces to each other, but not adhering with any considerable force. M. Sage obtained regular crystals of most of the amalgams in the following way:—Having prepared a very fluid amalgam, by adding four, five, or six times a greater quantity of mercury than of the other metal, he put it into retort, and proceeded to distillation in a sand-bath, till a fourth, or even a third, of the mercury had been driven off; the residue, being then allowed to cool very gradually, was found regularly crystallized at the bottom of the vessel. He thus obtained silver amalgam in the form of articulated tetrahedrons, aluminiform octahedrons, resembling the native dendritic silver. In the same manner the amalgams of gold, bismuth, tin, and zinc, assumed the form of regular crystals; but it is found that crystals of copper, arsenic, and antimony could not be obtained by this mode.

AMALGAMA, or AMALGAM, is amongst chemists expressed by the character  or  The operation of amalgamation is marked by three letters, A A A

AMALTHÆA, in fabulous history, the name of the Cumæan Sibyl, who is said to have offered to Tarquin II. nine books, containing the Roman destinies, and demanded 300 pieces of gold for them. He derided her; whereupon she threw three of them into the fire; and asked the same price for the other six; which being denied, she burnt three more; and still demanded the same price. Upon which Tarquin, consulting the pontiffs, was advised to buy them. These books were in such esteem, that two magistrates were created to consult them upon extraordinary occasions. The books, and the whole story concerning them, appear to have been fabrications of the Roman priests to impose upon that superstitious people, and increase their own importance, by occasionally quoting and pretending to interpret these Sibylline oracles.

AMALTHEA, in pagan mythology, the daughter of Melissus, king of Crete, and the nurse of Jupiter, whom she fed with goats' milk and honey. According to others, Amalthea was a goat, which Jupiter, after he died, translated into the sky, with her two kids, and gave one of her horns to the daughters of Melissus, as a reward for the pains they had taken in attending him. This horn had the peculiar property of furnishing them with whatever they wished for, and was thence called the cornucopœ, or horn of plenty. See *Aegis*.

AMALTHEUS, (Jerome, John Baptist, and Cornelius), three celebrated Latin poets of Italy, who flourished in the 16th century. Their compositions were printed at Amsterdam, in 1685. One of the best pieces in that collection is an epigram on two children, whose beauty was very extraordinary, though each of them was deprived of an eye :

Lumine Acon dextro, capta est Leonilla sinistro,
Et poterat forma vincere uterque deos.

Parve puer, lumen quod habes concede sorori;
Sic tu cæcus Amor, sic erit illa Venus.

The following imitation in English, comes far short of the original, but may convey to the unlearned reader a faint idea of the humour of the epigram :

Acon and Leonilla are
Each of one eye bereft.
The boy the right deplores; the fair
Mourns that she wants the left.
Each might with gods in beauty vie.
And could the lad but spare
His light, blind Cupid he might be,
And she a Venus fair.

AMANA, a mountain beyond Jordan, in the half tribe of Manasseh.

AMANCE, a town of Franche Comté, France, the head of a canton in the department of the Upper Saone, arrondissement of Vézoul, 15 miles north of Vézoul. This place was first assigned to France, at the peace of Baden, in 1714; and formerly contained a celebrated abbey, the chapter of which was composed of 44 ecclesiastics, one third of whose places were in the gift of the crown. The abbey church is still admired for the boldness and elegance of its architecture. Here are chalybeate waters, much recommended for rheumatism and the stone; they are impregnated with sulphur and salt. The manufactures

have gone to decay, with the exception of a pottery, which produces very fine earthen ware; the inhabitants of the neighbourhood are chiefly occupied in spinning.

AMANCE, a town of France, seated on a river of that name, six miles east of Nanci, in the department of the Meurthe.

AMAND, St. a town of France, seated upon the river Cher, in the department of Cher, 25 miles south of Bourges. It was built in 1410, on the ruins of Orval, and is the head of an arrondissement, containing 12 cantons. It has iron works, a cannon foundry, and a great trade in corn and wine. Inhabitants about 5000.

AMAND, St. a fortified town of France, in the department of the North, seated upon the river Scarpe, three leagues north of Valenciennes. It contains from 8000 to 9000 inhabitants. Lon. 3°. 35'. E. lat. 50°. 27'. N.

AMAND, St. or **AMANS**, St. a town of France, in Languedoc, the head of a canton in the department of the Lozère, arrondissement of Mende, with 3380 inhabitants. Four leagues north of Mende.

AMAND, St. or **ST. AMAND DE VALHORET**, a town of France, on the river Tauré, in Languedoc, the chief town of a canton in the department of the Tarn, arrondissement of Castres, with 2015 inhabitants. It is 5½ leagues south-east of Castres.

AMAND, St. a town of France, in the Nivernais, with 1500 inhabitants, the head of a canton in the department of the Nièvre, arrondissement of Cosne; noted for the manufacture of earthenware. 13½ leagues north of Nevers.

AMAND, St. a town of France, in Champagne, department of the Marne, arrondissement of Vitry, with 1060 inhabitants. It was formerly the seat of a commandery of the order of Malta. 5½ leagues south-east of Châlons.

AMAND DE BOUËX, St. a town of France, in the Angoumois, with 1410 inhabitants, and formerly with an abbey; it is now the head of a canton, in the department of the Charente, arrondissement of Angoulême, from which it is distant north, about four leagues.

AMAND, St. (Mark Anthony General, sieur de) a French poet, was born at Rouen, in Normandy, in 1594. His father commanded a squadron of ships in the service of queen Elizabeth, for 22 years, and our poet was for three years a prisoner in the Black Tower at Constantinople; two of his brothers having been killed in an engagement against the Turks. His life was spent in a continual succession of travels. The greater part of his poems are comic; the best edition is that of Paris, in 8 vols. 1649. He died in 1661.

AMANDAVA, in ornithology, a species of fringilla found in Bengal, and concisely described by Linnæus, as being of a brown and reddish colour, spotted with white. It is about the size of a wren, or four inches in length; the upper part of the plumage brown, with a mixture of dull red, the under part of the same colours, but naked, except the middle of the belly which is darkest. It has been called the Bengal finch, or Amaduvade; in allusion to which Brisson names it *Bengalus punctatus*, and Buffon

Bengale piqueté. There is a variety of this species, the Amandava (β) of Linnaeus, hitherto found only in Bengal, which is said to be entirely brown, and without spots. It is the Bengalus fuscus of Brisson, and Bengale brun of Buffon.

AMANDINUS LAPIS, in mineralogy, a gum of various colours, said to resist poisons.

AMANIBO, a river of South America, in Dutch Guiana, which enters the Atlantic, near the lake of Iracubo, in lat. $5^{\circ} 57'$. N.; also a town on the coast between Paramaribo and Cavenue.

AMANICÆ PYLÆ, } Straits in Mount
AMANIDES PYLÆ, or } Amanus, through

AMANI PORTÆ, } which Darius entered Cilicia; at a greater distance from the sea than the Pylæ Cilicæ, through which Alexander passed.

AMANITA, in botany, (from α , privative, and *μανία*, madness, i. e. the least hurtful of all the species,) an old Greek name for fungi in general, and used by Haller, after Dillenius, for the whole Linnaean genus of Agaricus, or nearly so. Persoon adopts it for such species only as are furnished with a volva, which, on that account, he considers distinct. See AGARICUS.

AMANOA, in botany, a genus of the pentandria monogynia class and order. Its characters are: CALYX quinquepartite: no cor.; the germe is triangular, the stigma trigonous, concave, and funnibiated. There is one species, viz. A. Guianensis. Aubl. pl. gui.

AMANTEA, a sea-port town of Naples, situated near the bay of Euphemia, in the province of Calabria, 20 miles south-west of Cosenza.

AMANUENSIS, n. Low Latin, *amanuensis*, the principal ingredient in which is *manus*, the hand: one who assists another with his penmanship, or hand-writing only.

I have no such authority, no such benefactors, as that noble Ambrosius was to Origen, allowing him six or seven *amanuenses* to write out his dictates; I must for that cause do my business myself.

Burton's Anat. of Mel. Dem. to the reader.

The mirth of the commons grew so very outrageous, that it found out work for our friend of the quorum, who by the help of his *amanuensis* took down all their names and their crimes, with a design to produce his manuscript at the quarter sessions, &c. &c. &c.

Spectator, No. 617.

AMANUS, in ancient geography, a mountain of Syria, which separates it from Cilicia, the straits of which are the Amanicæ Pylæ mentioned above. It is a branch of mount Taurus, extending chiefly eastward, from the sea of Cilicia, to the Euphrates; and is now called Monte Negro, or rather Montagna Neres, by the inhabitants; that is, the watery mountain as it abounds in springs and rivulets. It is celebrated by Appian as the retreat of wild beasts. Κυνηγ. l. 3. Κελωνάς τε πάγις και πρῶνας Αμάυρα.

AMAPALLA, a city of South America, in the province of Guatimala in Mexico, seated on the gulph of the same name in the Pacific Ocean, 220 miles south-east of the town of Guatimala, and four leagues from St. Miguel. It trades in cochineal, cocoa, indigo, hides, &c.

AMAPALLA, a large gulf or bay on the west coast of America, between the province of Guatimala and Nicaragua. It is nearly sixty miles in length, and from nine to thirty in breadth. It is also called the gulf of Fonseca, 100 miles northwest of Leon. Lon. $88^{\circ} 56'$. W. lat. $13^{\circ} 30'$. N.

AMARA, in antiquity, *ἀμάρα*, a furrow or channel through which water flows.

AMARA, in medicine, bitters, or the essence of a bitter substance; of which great use is made in medicine, particularly for bracing the relaxed fibres of the organs of digestion.

AMARA DULCIS, in botany, the solanum dulcara.—AMARA INDICA, the momordica charantia of Linnaeus.

AMARA (Singha), a Hindoo brahmin of the first century, the author of a Sanscrit dictionary, entitled, Amara Kocha, including the names of stars, elements, &c. The first part of this dictionary was published at Rome by Father Paulin, in 1798, entitled, Amara Singha, Sectio Prima de Cœlo ex tribus ineditis Codicibus Manuscriptis, 4to. A manuscript of the whole is preserved in the royal library at Paris.

AMARACUS, among ancient naturalists. See SAMPUSCHUS.

AMARACUS, in botany, bastard feverfew.

AMARADYUS, in botany, a name sometimes given to the red nightshade.

AMARANTE, an order of knighthood, instituted in Sweden by queen Christina in 1653, at an annual feast; at the close of which she threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the masques. In memory of this ridiculous scramble, she founded a military order, called in Swedish, Ceschilschafft, into which all present at the feast were admitted, including sixteen lords, and as many ladies, besides the queen. Their device was the cypher of Amarante, composed of two A's, the one erect, the other inverted, and interwoven together; the whole enclosed by a laurel crown, with this motto, 'Dolce nella memoria.'

AMARANTE, a town of Portugal, in Entre-Duero-e-Minho. It has a linen manufacture, and contains about 4000 inhabitants; 23 miles south-east of Braga.

AMARANTH, n. } α , not; and *μαρανθω*, to

AMARANTHINE, } wither. 'Its nature is expressed by its name,' says Pliny, 'since it does not fade.' A well-known plant of the description vulgarly called Everlasting. The amaranthus of poetry is not described, at least by botanists, and is supposed to be imaginary.

Some roots are yellow, as carrots, and some plants blood-red, stalk and leaf, as the *amaranthus*.

Bacon's Nat. and Exper. History.

Immortal amaranth! a flower which once
In paradise, fast by the tree of life,
Began to bloom; but soon, for man's offence,
To heav'n remov'd, where first it grew: there grows,
And flow'r's aloft, shading the fount of life;
And where the river of bliss, through midst of heav'n,
Rolls o'er Elysian flow'rs her amber stream:
With these that never fade, the spirits elect
Bind their resplendent locks, inwreath'd with beams.

Milton's Par. Lost.

By the streams that ever flow,

By the fragrant winds that blow

O'er the Elysian flow'rs;

By those happy souls that dwell
In yellow meads of asphodel,

Or amaranthine bow'rs.

Pope.

Whatever was brought before her, she beheld by the steady light of the torch of truth; and when her examination had convinced her that the laws of just writing had been observed, she touched it with the amaranthine end of the sceptre, and consigned it over to immortality.

Bambler.

The only amaranthine flow'r on earth
Is virtue; th' only lasting treasure, truth.

Couper's Task, book iii.

AMARANTHOIDES, in botany, the trivial name of a species of illecebrum.

AMARANTHUS, in botany, from *a* privative, and *μαρανθω*, to wither; because the flower of this plant, when cropped, does not soon wither. Amaranth, or flower-gentle, according to Dioscorides, was a remedy against the bites of serpents: A genus of the pentandria order belonging to the monoecia class of plants; and in the natural method ranking under the 54th order, miscellanea: The characters are, the male CAL. a five or three-leaved perianthium, erect, coloured, and persistent: no COR.: STAM. consist of five or three erect capillary filaments, the length of the calyx; the anthers are oblong and versatile: the female CAL. the same as the male, and no COR.: PIST. an ovary, germen; the stylis three, short, and stipulated; the stigmata simple and persistent: PER. an ovate capsule, three beaked, unilocular, and cut round: the seed is one, globular, compressed, and large. Of this genus Linnaeus enumerates nineteen species; the most remarkable of which are:—1. A. bicolor, melancholicus, or two-coloured amaranthus. This greatly resembles the Tricolor, in its manner of growth; but the leaves have only two colours, which are an obscure purple, and a bright crimson. 2. A. caudatus, with very long hanging cylindrical spikes. This species is a native of America. It has an upright stem, three feet high; the leaves and stalks are of a pale green. The spikes of flowers are produced from the wings of the stalks, and at the extremities of the branches. They are of a bright purple colour, and hang downward, sometimes two feet and a half long, so that many of them touch the ground. 3. A. maximus, or tree-like amaranthus, grows with a strong stem to the height of seven or eight feet. 4. A. oleraceus, with obtuse indented leaves. This has no beauty; but it is used by the Indians as a substitute for cabbage. 5. A. sanguineus, with compound spikes and oblong oval leaves, a native of the Bahama islands, is an esculent plant, and bears fine flowers. 6. A. tricolor, or three-coloured amaranthus. This has been long cultivated in gardens, on account of the beauty of its variegated leaves, which are green, yellow, and red; very elegantly mixed.

AMARANTHUS is also the thirtieth natural order in Jussieu's system, being the first of his seventh class. The following are the characters of these amaranti: CAL. divided, more or less deeply, often surrounded by scales at the base: STAM. definite, sometimes distinct, sometimes monadelphous; in some genera there are scales alternate with the filaments; in others the combined

filaments form a tube or sheath: GERM. simple, style or stigma simple, or double, or triple: CAPS. of one cell, with an unconnected receptacle, and either bursting at the summit, or splitting all round, containing one or many seeds: CORCULUM curved round a farinaceous mass. Flowers capitate or spiked. Leaves generally undivided and pointed; in some alternate; in others opposite; in a few instances accompanied by stipulas: STEM. for the most part herbaceous. Stamens and pistils sometimes in separate flowers.

Under his first section, (leaves alternate, without stipulas,) Jussieu enumerates amaranthus and celosia of Linnaeus; with aerua of Forskall, a genus formed of alternate-leaved species of illecebrum; and digera of the same author, to which achyranthes muricata of Linnaeus is supposed to belong. §. 2. Leaves opposite without stipulas, consists of ircesine, achyranthes, gomphrena, and illecebrum. §. 3. Leaves opposite, with stipulas. Here are ranged paronychia of Tournefort, separated from the Linnaean illecebrum; and hernaria of all authors. This order, as Jussieu candidly observes, is very nearly related to that of the caryophyllea. Jussieu, in the Annales du Museum, v. 2. 131, has published some additions to the present order, which, according to a recent alteration in the nomenclature of natural orders, he there terms amaranthaceae. A translation of his paper may be seen in Sims and Konig's Ann. of Bot. v. 2. 274. To the section with stipulated leaves, he adds three new genera. 1. Anychia of Michaux, to which belongs queria canadensis of Linnaeus. 2. Lithophilis of Swartz. 3. Polychroa of Loureiro. Jussieu also remarks, that cyathula of Loureiro, a plant of this order, is really an achyranthes with a many-cleft stigma; but that polia of the same author, supposed to belong to the amaranthi, is one of the caryophyllea.

AMAREILLA, in botany, feverfew.

AMARIN, or **DAMARIN**, a small town of France, in the department of the Upper Rhine, on the Thur, has 1400 inhabitants. It is the head of a canton, and has a good iron trade supplied by the valley of Amarim, which is rich in that metal.

AMARAWDH, prince of North Wales, the son of Roderick the Great, king of Wales, and the sixth in a direct line from Cadwallader, the last king of the South Britons, succeeded his father, A. D. 877, in North Wales, the southern principality being allotted to his brother, and had various wars with the Danes and Anglo-Saxons. He died, A. D. 913, in the 36th year of his reign.

AMARUCO, a river of South America, which traverses the eastern part of Guiana, and falls from the south into the Orinoco, just at its mouth. It is navigable for sloops about ten or twelve miles.

AMARUM, in mineralogy, sulphate of magnesia, or Epsom salt; a genus of mineral substances; class salts; a bitter taste, easily soluble in water, and melting in heat.

AMARUMAJU, a considerable river of South America, in the kingdom of Peru, which rises in the Cordillera of the Andes, in 13°. 30'. S. lat. It passes through the province of Mojos, and

after frequently changing its name, enters the Amazonas in 4°. 36'. S. lat.

AMARUS DULCIS ORIENTALIS, in botany, costus.

AMARUS, in mineralogy, a genus of earths, of the class silices, consisting of silica, with a small portion of magnesia, alumina, and carbonate of lime.

AMARYLLIS, lily-asphodel: a genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the ninth order, spathaceæ. The characters are: CAL. an oblong obtuse spatha, emarginated, and withering: COR. six petals, lanced: STAM. six subulated filaments: the ANTHÆRE oblong, incumbent and ascending: PIST. a roundish fulcated germen beneath; a filiform stylus, nearly the length of the stamina: the STIGMA trifid and slender: PER. is an ovate trilocular capsule, with three valves: the seeds are many. The principal species are: 1. A. farinensis, or Guernsey lily, is supposed to have come originally from Japan, but has been many years cultivated in the gardens of Guernsey and Jersey; in both which places it seems to thrive as well as if they were in their native country, and from these islands its roots are sent annually to the curious in most parts of Europe. 2. A. formosissima, or jacobæa lily, produces its flowers two or three times a year, without being regular to any season. 3. A. lutea, or autumnal narcissus. 4. A. Orientalis, or lily daffodil, with leaves shaped like a tongue. This is a native of the Cape of Good Hope. 5. A. Regina, or belladonna lily, is a native of Portugal, where it was formerly cultivated in great plenty; but of late it has been supplanted by the jacobæa lily, so that the roots which have been brought from that country for some time past for the belladonna, have generally proved to be the jacobæa lily. 6. A. Zeylanica, or Ceylon lily, is a native of the West Indies, and usually flowers in June. Sometimes the same root will flower again in autumn, but the flowers are of no long duration. These three last species of the amaryllis may easily be raised by taking care to shelter them in a stove from the winter's cold.

AMASA, אַמָּזָה, Heb. i. e. sparing the people: the son (by some supposed illegitimate) of Abigail, the sister of David, by Jether. See 2 Sam. xx. 10.

AMASAI, the son of Elkanah, a principal officer under Saul, who, with a number of his friends, joined David in his exile. 1 Chron. xii.

AMASIA, an ancient city of Germany, now Marpurg, in the landgravate of Hesse, on the Lahn. According to others, it is Embden in Westphalia.

AMASIA, an ancient town of Turkey, in Nottolia, the capital of the district of that name, and memorable for the birth of Strabo the geographer. It is the residence of a bashaw, and is seated near the river Iris or Kasalmack, fifty miles north-west of Tocat, and two hundred east of Constantinople. It was anciently the residence of the kings of Cappadocia. It is commanded by a fort, situated at the highest part of the town, on a sharp-pointed rock, and is surrounded by mountains, so that it can be ap-

proached only by two narrow passes on the north and south, which are so rugged as to be easily defensible. Though an extensive and populous place, the streets are narrow and dirty, and most of the houses are built of wood. The greater part of the inhabitants being Christians, there is only one mosque, a fine edifice with two lofty minarets, all of hewn stone; of which material the numerous baths, and some few of the better houses, are also constructed. The baths have agreeable promenades in front, with several rows of trees; and the whole are surrounded with a high wall. The river is large and rapid, and affords abundance of water, which is raised by means of wheels nearly thirty feet in diameter, filling buckets on their circumference, which empty themselves into troughs or reservoirs: and the water is thence conveyed in pipes to the baths and fountains. A kind of good wine, resembling sherry, is made in Amasia; and the environs produce abundance of fruits. The inhabitants are distinguished for their urbanity and attention to strangers, and the women are celebrated as the fairest and most engaging of all Asia Minor. Population from 60,000 to 70,000 Long. 36°. 12'. E. lat. 40°. 40'. N.

AMASIS, first prime minister, and afterwards king of Egypt. He owed his royal dignity to a very singular circumstance. Apries, king of Egypt, or, as he is called in scripture, Pharaoh Hophra, having by his oppressions excited the Egyptians to revolt, sent his minister Amasis to pacify them; when the people, while he was haranguing them, brought a crown and other ensigns of royalty, and forcing them upon him proclaimed him king. He was afterwards countenanced by Nebuchadnezzar, king of Babylon, who assisted him against Apries. He made a law that all his subjects should annually give an account of their means of support; and refused to continue his alliance with Polycrates, of Sicily, on account of his extraordinary prosperity. The close of his reign was, however, very different from its commencement. Having by some means or other incurred the displeasure of Cambyses, the Persian monarch prepared to invade Egypt, and derived effectual assistance from Phanes, of Halicarnassus, who commanded the Greek auxiliaries in the pay of Amasis. But Amasis was rescued from the evils that were gathering round him, by death, B. C. 525, after a reign of forty-four years. His body being embalmed, was deposited in a sepulchre which he had built for himself in the temple at Sais. The reign of his successor, Psammenitus, was short and calamitous; and the victorious Persians, after his defeat, capture, and death, took the body of his father Amasis from the tomb, mangled it in a shocking manner, and then burnt it to the great disgust of the Egyptians.—Herod. i. ii. iii.

AMASONIA, in botany, a genus of the angiospermia order, belonging to the didynamia class of plants. The characters of which are: CAL. a tripartite monophylous perianthium, bell-shaped and persistent: COR. monopetalous and tubular; the border quinquefid, expanding and small: STAM. four filaments longer than the corolla; the antheræ oval and incumbent: PIST.

an ovate germe; the stylus the length of the stamens; the stigma two, acute; there is no pericarpium: SEED an ovate unilocular nut, the length of the calyx.

AMASS', v. & n. } Fr. *amassee*; Lat. *massa*;

AMASS'KENT. } Gr. *μασσω*, to knead into a lump. Things which when heaped together unite, are said to be amassed.

For treasure spent in lyef, the body doth susteyne :
The heire shall waste the whourded gold amased with
muche payne. *Surrey.*

The last is the compounded order: His name being a brief of his nature. For this pillar is nothing in effect, but a medly, or an *amassee* of all the precedent ornaments.

Reliquiae Wottonianae.

The rich man is not blamed, as having made use of any unlawful means to *amassee* riches, as having thriven by fraud and injustice. *Atterbury's Ser.*

When we would think of infinite space, or duration, we, at first step, usually make some very large idea, as perhaps of millions of ages, or miles, which possibly we double and multiply several times. All that we thus *amassee* together in our thoughts, is positive, and the assemblage of a great number of positive ideas of space or duration. *Locke.*

AMASTRIS, AMASTRO, a sea-port of Anatolia, in Turkey; but its two harbours have been long choked up with sand; and little of its ancient splendour now remains, except some ruins.

AMATA, in fabulo, ~~myth~~, the wife of king Latinus, and the mother of Lavinia, who hanged herself that she might not see Aeneas married to her daughter.

AMATARIA, in entomology, a species of the Phalena, of the geometria family, that inhabits Europe. The wings are angulated, of a pale brown, slightly speckled, with an obsolete darker waved streak, and a straight purple line across the middle. It is produced from a green larva, with yellow rings, that feeds on the leaves of oaks. *Linnaeus. Don. British Insects*, tab. 33. fig. 2.

AMATE'. A. S. *mæt*. To dream: to be made stupid; senseless.

But thought and sicknesse were occasion
That he thus lay in lamentation,
Grouffe on the ground, in place desolate
Sole by himself, awaphed and *amate*.

Chaucer. Complaint of the Blache Knight, f. 271, c. 3.

Upon the wall the pagans old and young
Stood hush'd and still, *amate* and amazed.

Fairf. b. xi. xii.

No more appal'd with fear
Of present death, than he whom never dread
Did once *amate*. *O. Pl. 2. 214.*
For never knight, that dared warlike deed,
More luckless disadventures did *amate*.

Spens. 1. 2. 1. 9. 45.

AMATEUR. Fr. one who has a taste for an art, but does not practise it professionally.

It must always be to those who are the greatest *amateurs*, or even professors of revolutions, a matter very hard to prove, that the late French government was so bad, that nothing worse, in the infinite devices of men, could come in its place. *Burke.*

AMATHI, in ancient geography, a town of Phoenicia, sacred to Venus; which had an ancient temple dedicated to that goddess.

AMATHIA, a city on the Jordan.

AMATHUS, an ancient town in the south of

Cyprus, so called from Amathus the founder; or from Amath in Phoenicia. It had a very ancient temple of Venus and Adonis: and, according to Ovid, was rich in copper ore. It is now called Limisso.

AMATHUS, a town of the tribe of Gad, beyond Jordan; but at what distance from it, is not determined.

AMATI, a violin maker of Cremona, who lived about the year 1600, and by his own and his family's skill gave name to the Amati violins, which are still considered, with the exception perhaps of Stainer's, the first in the world. They are also called Cremonas.

AMATORIAL, adj.

AMATOR'IOUS, } Amo; *amator*: to
AMATOR'IAN, } love; a lover. Of,
AMATORY. } or concerning love.

They seem to have been tales of love and chivalry, amatorial sonnets, tragedies, comedies, and pastorals.

Warton's Hist. Eng. Poetry, iv. 7.

It is the same thing whether one ravish Lucretia by force, as Tarquin, or by *amatory* notions not only allure her, but necessitate her to satisfy his lust, and incline her effectually, and draw her inevitably, to follow him spontaneously. *Bramhall against Hobbes.*

AMATORII MUSCULI, in antiquity, a term sometimes used for the obliquus superior and obliquus inferior muscles of the eye, as these muscles assist in ogling, or drawing the eye sideways.

AMAURI I. and II. kings of Jerusalem: the first succeeded to the throne in 1163, and was a courageous and enterprising prince, but these qualities were sullied by avarice and cruelty. He died in 1174.—Amauri II. succeeded his brother, Guy de Lusignan, in 1194; his title was contested by Isabella, second daughter of Amauri I.; but on her becoming a widow, he married her, and was crowned. The Saracens having taken his capital, he applied for assistance to the European princes, but before the succours arrived he died, in 1205.

AMAUROSIS, from *ἀμαρπω*, to darken, in medicine, is by some defined to be a deprivation of sight, the eye remaining fair and seemingly unaffected. A perfect amaurosis is when the blindness is total; when there is still a power of distinguishing light from darkness, the disease is called by M. de St. Ives an imperfect amaurosis. There is a periodical sort which comes on instantaneously, continues for hours or days, and then disappears. Mr. Hey, surgeon at Leeds, mentions several cases of patients afflicted with the amaurosis who were relieved by being electrified.

AMAZE', v. & n. } From the Dutch, *missen*:
AMAZEDLY, } to miss, to err, to wander.
AMAZED', } Hence maze, a labyrinth.
AMAZEDNESS, } To maze occurs in our
AMAZE'MENT, } older writers. To effe-
AMAZ'ING, } with what is incompre-
AMAZ'INOLY. } hensible; to confound.
From the Dutch, *missen*:
To miss, to err, to wander.
Hence maze, a labyrinth.
To maze occurs in our
older writers. To effe-
with what is incompre-
hensible; to confound.
perplex, astonish, stupify.

I am right aiker, that the pot was crased;
Be as be may, be ye no thing *amate*.
As usage is, let swepe the flore as swithe;
Plucke up your hertes and be glad and bliitho.
Chaucer. The Chanones Yemannes Tale.

Hear O Israell, ye are come vnto battell agenste
yor enemyes, let not your hertes faynte, neither feare,
nor be amased nor a dread of them.

Bible, 1539. Deuteronomie, c. xx.

Yea, I will make many people amased at thee, and
their kings shall be horribly afraid for thee, when I
shall brandish my sword before them, and they shall
tremble at every moment; every man for his own
life in the day of the fall.

Ezekiel.

He answer'd nought at all; but adding new
Fear to his first amazement, staring wide,
With stony eyes, and heartless hollow hue,
Astonish'd stood, as one that had esp'y'd
Infernal furies, with their chains unty'd.

Faerie Queene.

But look! amazement on thy mother sits;
O step between her and her fighting soul:
Conceit in weakest bodies strongest works. Shakesp.
But why

Stands Macbeth thus amaxed?
Come, sisters, cheer we up his sprights.

Id.

He ended, and his words impression left
Of much amazement to th' infernal crew,
Distracted and surpris'd with deep dismay
At these sad tidings.

Milton.

Fairfax, whose name in arms thro' Europe rings,
And fills all mouths with envy or with praise,
And all her jealous monarchs with amaze.

Id.

Meantime the Trojan cuts his wat'ry way,
Fix'd on his voyage, through the curling sea;
Then casting back his eyes with dire amaze,
Sees on the Punick shore the mounting blaze.

Dry.

ALM. As when some dreadful thunder-clap is nigh,
The winged fire shoots swiftly through the sky;
Strikes and consumes ere scarce it does appear,
And by the sudden ill prevents the fear:
Such is my state in this amazing woe,
It leaves no power to think, much less to do.

Dryden's Indian Emperor.

An amphitheatre's amazing height
Here nills my eye with terror and delight,
That on its public shows, unpeopled Rome,
And held, uncrowded, nations in its womb.

Addison.

It is an amazing thing to see the present desolation
of Italy, when one considers what incredible multitudes
it abounded with during the reigns of the
Roman Emperors.

Addison.

Know'st thou the importance of a soul immortal?
Behold this midnight glory, worlds on worlds!
Amazing pom'p! redouble the amaze!

Ten thousand add, and twice ten thousand more;
Then weigh the soul, one soul outweighs them all.

Young.

AMAZIAH, the eighth, or including the
usurper Athaliah, the ninth monarch of Judah,
succeeded his father Joash, A. M. 3164, or according
to Alstedius, A. M. 3109. See 2 Kings,
xiv. and 2 Chron. xxv.

AMAZIAH, the priest of Bethel, under Jeroboam, II. king of Israel.

AM'AZON, n. } Gr. *a*, without; *μαζως*, the
AMAZO'NIAN. } breast. A warlike woman, a
virago.

When the strong town of Hennebond, near Rennes, was besieged by the French, this redoubtable amazon [the Countess of Montfort] rode in complete armour from street to street, on a large courser, animating the garrison.

Warton's Hist. Eng. Poetry, i. 254.

I do not with less willingness own my weakness than my sex, being far from any such *amazonian* boldness as affects to contend with so many learned and godly men.

Bp. Taylor's Artificial Handsomeness.

AMAZONIA, a country of South America, situated between the equator. Its boundaries

VOL. I.

are: on the north, Terra Firma and Guiana; on the east, the Atlantic Ocean and Brazil; on the south, Paraguay; and on the west, Peru.—This country was first discovered, and so named, by Francisco Orellana, who, about the year 1541, in a bark manned with fifty soldiers, was borne down by the stream of the river Napo into the channel of the Maragnon; and pretended to have discovered along its banks nations so rich that the roofs of their temples were covered with plates of gold; he also described a warlike and powerful republic of women, who, with arms in their hands, opposed his passage, and hence he called the country Amazonia; and the river, which had formerly been denominated Maragnon Amazon.

AMAZONIUM, a place near Athens, so called from a battle fought between the Athenians and the Amazons.

AMAZONIUS, in pharmacy, a kind of pastil, or troche, anciently used against risings of the stomach and vomitings. It is composed of smallage, anise-seed, wormwood, myrrh, pepper, castorium, opium, &c. cinnamon.

AMAZONS, in antiquity, a nation of female warriors, who are said to have founded an empire in Asia Minor upon the river Thermoodoon, along the coast of the Black Sea, as far as the Caspian; and indeed a state from which men were excluded.

Mercede they had with that sex was only with strangers, and that for the purpose of continuing the race; they killed all their male children; and they cut off the right breasts of their female ones, to make them more fit for the combat. From that last circumstance it is, that they are supposed to take their name, which is compounded of the privative *α* and *μαζως*, breast. But Dr. Bryant, in his Analysis of Ancient Mythology, explodes this account as fabulous; and observes, that they were in general Cuthite colonies from Egypt and Syria, who formed settlements in different countries, and that they derived their name from zon, the sun, which was the national object of worship. It has indeed been controverted, even among ancient writers whether there really ever were such a nation as that of the Amazons. Strabo, Papephatus, and others, deny it; whilst Herodotus, Pausanias, Diodorus Siculus, Trogus Pompeius, Justin, Pliny, Mela, Plutarch, &c. expressly assert their existence. The most ancient Greek writers mention the Amazons. In the third book of the Iliad, Priam speaks of having been present in a battle with them; and some of them are said afterwards to come to the assistance of that prince during the siege of Troy.

They are also mentioned by Herodotus, who says that the Grecians defeated them on the river Thermoodoon. After their victory, they carried off all the Amazons they could take alive, in three ships. But while they were at sea, the Amazons conspired against the men, and killed them all. Having no knowledge of navigation, they were now driven by wind and tide towards the precipices of the lake Mæotis, in the Scythian territories. Here they went ashore, seized the first horses they met with, and began to plunder the inhabitants. The Scythians at first supposed them to be men; but after they had

taken some prisoners, and discovered them to be women, they were unwilling to carry on hostilities against them. By degrees a number of the young Scythians took these gentle dames as wives, who prevailed with their husbands to retire to Sarmatia. ‘Hence,’ says Herodotus, ‘the wives of the Sarmatians continue their ancient way of living. They hunt on horseback in the company of their husbands, and sometimes alone; they march with their armies, and wear the same dress with the men: and no virgin is permitted to marry till she has killed an enemy in the field. Diodorus Siculus has described a similar people who dwelt near the Thermoodoon, who were subject to the government of women, and in which females managed all the military affairs like men.

Justin represents the Amazonian republic to have arisen in Scythia. The Scythians had a great part of Asia under their dominion upwards of 400 years, till they were conquered by Ninus, the founder of the Assyrian empire. After his death, which happened about 1150 years before the Christian era, and that of Semiramis and their son Ninus Ilinus, and Scopites, princes of the blood royal of Scythia, were driven from their country by other princes, who like them aspired to the crown.—They departed with their wives, children and friends; and being followed by a great number of young people of both sexes, passed into Asiatic Sarmatia, beyond mount Caucasus, where they formed an establishment, and supplied themselves with what they wanted, by making excursions into the countries bordering on the Euxine sea. The people of those countries, exasperated by the incursions of their new neighbours, united, surprised, and massacred the men. The women then resolving to revenge their death, and to provide for their own security, formed a new kind of government; chose a queen; enacted laws; and maintained themselves, without men; for ever renouncing marriage, which they considered an insupportable slavery. For the continuance of the race, however, they made a law to go every year to the frontiers, and invite men to come to them, but to leave them as soon as they were pregnant. The female infants among the Amazons were educated; but the boys, if we believe Justin, were strangled at the moment of their birth. According to Diodorus Siculus, they crippled their legs and arms, so as to render them unfit for military exercises. Quintus Curtius, Phulostratus, and Jordarus, say, that the less savage sent them to their fathers. Their right breast is said to have been burnt off, by applying to it, at eight years of age, a hot brazen instrument; but other writers state that this breast was constantly compressed from infancy, so as to prevent its growth, at least so far as to hinder its ever being incommodeous in war.

Plutarch, in his life of Theseus, speaks of a battle which had been fought between the Athenians and the Amazons at Athens, and says, that the graves of those that were slain, were to be seen in the streets that lead to the gate Piraeus, by the temple of the hero Chalcoöde. In another place he states, that ‘it appears, that the passage of the Amazons through Thessaly was not without opposition; for there are yet to be seen many of their

sepulchres near Scrotusæa and Cynocephala. And in his life of Pompey, that, ‘they inhabit those parts of mount Caucasus that look toward the Hyrcanian Sea, (not bordering upon the Albanians, for the territories of the Getæ and the Leges lie between): and with these people do they yearly, for two months only, accompany and cohabit near the river Thermoodoon. Quintus Curtius states, the nation of the Amazons to be situated upon the borders of Hyreania in the plains of Thermiscyra. Their queen was named Thalestris, and she had under her subjection all the country that lies between mount Caucasus and the river Phasis. This queen came out of her dominions, in consequence of an ardent desire she had conceived to see Alexander, and sent messengers to acquaint him that she was come to have the satisfaction of an interview. Having obtained permission to visit him, she advanced with 300 of her Amazons, leaving the rest of her troops behind; and arriving within sight of the king, leaped from her horse, holding two javelins in her right hand. She surveyed Alexander with an undaunted countenance, and narrowly examined his person; when the king having asked whether she had any thing to desire of him, she replied, without scruple or hesitation, that she was come with a view to have children by him. Their offspring, if of the female sex, she would retain herself; and if of the male sex, it should be delivered to Alexander. He then asked her whether she would accompany him in his wars. But this she declined, alleging that she had left nobody to take care of her kingdom. Having accomplished her object, she returned home. Justin repeatedly mentions this visit of Thalestris to Alexander, and says, ‘she performed a march of twenty-five days in order to obtain the meeting. The interview between Alexander and Thalestris is likewise mentioned by Diodorus Siculus. The Amazons are represented as being armed with bows, arrows, and javelins; and also with an axe of a particular construction. According to the elder Pliny, it was invented by Penthesilia, their queen, who went to the Trojan war. On many ancient medals are representations of the Amazons, armed with these axes. They are also said to have had bucklers in the shape of a half-moon. The Amazons are mentioned by many other ancient authors besides those which have been enumerated; and if any credit be due to the accounts concerning them, they subsisted through several ages.

The ancient medals and monuments on which they are represented are also very numerous. The Abbé Guyon speaks of the history of the Amazons as having been regarded by many persons as fabulous, ‘rather from prejudice than from any real and solid examination.’

Among the striking instances of Amazonian conduct in modern ladies, may be mentioned that of Jane of Belleville, widow of Mons. de Clisson who was beheaded at Paris in the year 1353, on a suspicion of carrying on a correspondence with England and the Count de Montfort. This lady, filled with grief for the death of her husband, and exasperated at the ill treatment which she considered him as having received,

sent off 'her son secretly to London; and, when her apprehensions were removed with respect to him, sold her jewels, fitted out three ships, and put to sea, to revenge the death of her husband upon all the French with whom she should meet. This female corsair made several descents upon Normandy, where she stormed castles; and the inhabitants of that province were spectators more than once, whilst their villages were all in a blaze, of one of the finest women in Europe, with a sword in one hand and a torch in the other, urging the carnage, and eyeing with pleasure all the horrors of war.' Mezeral, says, that during the crusade in 1147 'many women did not content themselves with taking the cross, but also took up arms to defend it, and composed squadrons of females, which rendered credible all that has been said of the prowess of the Amazons.' In 1590, the League party obtained some troops from the king of Spain. Upon the news of their being disembarked, Barri de St. Aunez, Henry IV's governor at Luceate, sent out to communicate a scheme to the Duke de Montmorenci, commander of that province. He was taken in his way by some of the troops of the League, who were also upon their march with the Spaniards towards Leucate. They were persuaded that, by thus having the governor in their hands, the gates of that place would be immediately opened to them, or at least would not hold out long. But Constantia de Cecelli, his wife, after having assembled the garrison, put herself so resolutely at their head, pike in hand, that she inspired the weakest with courage; and the besiegers were repulsed wherever they presented themselves. Shame and their great loss having rendered them desperate, they sent a message to the courageous woman, acquainting her that if she continued to defend herself they would hang her husband. She replied, with tears in her eyes, 'I have riches in abundance: I have offered them, and I do still offer them, for his ransom; but I would not ignominiously purchase a life which he would reproach me with, and which he would be ashamed to enjoy. I will not dishonour him by treason against my king and country.' The besiegers having made a fresh attack without success, put her husband to death, and raised the siege. Henry IV. afterwards sent to this lady the brevet of governess of Leucate, with the reversion for her son. The famous maid of Orleans is a shining example of female courage and patriotism, well known to every reader; and her fate is an everlasting disgrace to the tyrant who murdered her. See *JOAN OF ARC*. In the end of the eighteenth century, the enthusiasm of French liberty and equality excited many females of that nation to commence Amazons, and follow their husbands, brothers, and lovers, to victory or death. The Abbé Arnard, in his memoirs, speaks of a countess of St. Balmont, who used to take the field with her husband and fight by his side. She sent several Spanish prisoners of her taking to Marshal Feuquires; and, what is not a little extraordinary, this Amazon at home was all affability and sweetness, and gave herself up to reading and acts of piety. John de los Santos, a Portuguese author, in his description of Ethio-

pia, speaks of a nation of Amazons existing in Africa; and Eneas Sylvius gives a very particular account of a nation of real Amazons in Bohemia.

AMAZONS, MARAGNON OR ORELLANA, a river of South America, and one of the largest in the world. It rises in Peru, between two ridges of the Andes, in about sixteen degrees of south latitude, under the name of the Apurimac; and flows northerly over a country overspread with forests; and expanding, by means of numerous tributary accessions, forms the Ucayale, about 300 geographical miles from its source. From this point it pursues a northerly direction for a distance of about six degrees, where it unites with the Tunguragua, and forms the Amazon. It then takes an easterly course, or nearly so, across the continent; and, after traversing 4000 miles, rolls its vast tide into the ocean with such violence that it repels all other waters, and carries its own stream pure and unmixed to the distance of eighty leagues. This circumstance is the more remarkable, as it is calculated that from Obidos, 400 miles from its mouth, the ground does not decline more than four feet. This river is navigable up to the very foot of the Andes, and is, at its mouth, 180 miles wide. The principal branches of the Amazon from the south are: 1. The ~~Paraná~~ Guararape and Ucayale, already described; 2. The Madeira, its principal tributary, which rises in the United Provinces near Potosí, about 20° S. lat.; and passing under various names into Brazil is joined by numerous other rivers, and rolls in a north-easterly direction to the Amazon, after a course of 2000 miles; 3. The Tocantins, which enters the Amazon near its mouth, after a course of about 1500 miles. Its tributary, the Araguay, rises between the parallels of 18° and 19° of south latitude. The other important tributaries of the Amazon from the south are, the Jutay, the Juruay, and the Puros, which join it between the Ucayale and the Madeira; and the Tapajos and Xingu, which join it between the Madeira and the Tocantins. The principal rivers which fall into the Amazon on its northern bank are, the Napo, the Icaor, the Putumayo, the Jupura, and the Negro, the last of which is remarkable for sending off a branch towards the north, which, under the name of Cassiquiare, falls into the Orinoco, and unites, by this means, the Amazon with that magnificent stream. All the rivers which rise on the eastern declivity of the Andes, between the parallels of 2° north latitude and 20° south, including a space of 1600 or 1700 miles, contribute to swell the waters of the common channel, by which this immense portion of South America is drained of its waters. The basin of the Amazons has been calculated at more than 1500 miles from north to south, and upwards of 200 from east to west, including a superficial area of 3,000,000 square miles, or nearly half of South America.

The banks of this river are clothed with immense and impenetrable woods, abounding with bears, tigers, leopards, wild boars, snakes, and serpents. Alligators are numerous, and frequently grow to the length of thirty feet. They are often seen stretched along on the banks, in appearance like long branches of timber covered

with rough dry bark. Turtles are numerous and excellent. Tortoises, or land-turtles, are found on the neighbouring shores. The neighbouring woods abound with a variety of birds of the most beautiful plumage, and with innumerable apes of the most extravagant and ridiculous appearances. The vegetable productions are—cocoa, cinnamon, vanilla, pines, coffee, sugar-canæs, plantains, lemons, limes, oranges, wax, storax, copal, rice, maize, balsams, resins, and medicinal plants. Woods, extremely precious, of every kind, colour, and size, are found here; as cedar, redwood, &c.; some of which are extremely hard, and resemble ebony. The current of this river is violent, and its depth unfathomable. The swellings and freshes which come on with the periodical rains are very great; the whole of the numerous islands in the channel of the river are then overflowed; many of them change their places on some occasions; others are formed by the new channels, which the boundless impenetrability of the river is accustomed to make for itself.

The climate of the countries watered by this stream is hot, moist, and unhealthy, especially on the shores. Countless varieties of mosquitoes, and other venomous insects, are nourished and invigorated by the daily exhalations foamed on its banks by the ~~heat~~ ^{force} of a burning sun. The river above the Pongo, a Spanish name for the narrow channel of the mountains, through which rivers emerge previously to their spreading over the plains, runs down a mountainous channel, and exhibits numerous cataracts, rapids, &c. At the Pongo the stream is suddenly contracted from a breadth of 1600 to 160 feet, and the current becomes amazingly rapid, so that a canoe or any other species of boat would inevitably be driven at the mercy of the stream, and dashed to pieces on the rocks. The difficult parts of the river are therefore passed in rafts of a particular construction, called Balses. In these, the different beams of which they are composed are neither dove-tailed nor nailed together, but are fastened by twigs called lianas, which are extremely flexible and elastic; so that when the raft strikes with violence against the rocks, the lianas have the effect of a spring, and by their elasticity deaden the shock. The greatest danger to which the navigator is exposed, is being carried by eddies out of the current, which he may find it almost impossible to regain. This accident happened to Condamine in navigating this river; and he relates that a short time before a missionary was thus drawn into the vortex, was kept in it for two days destitute of provisions; and but for a providential swell of the river, which brought him again into the current, might have perished for want. Condamine calculated, that in the narrowest part he was carried on his raft at the rate of two toises per second, which is equal to rather more than nine miles an hour. After he had emerged from this range of hills, he describes the aspect of the country as a maze of lakes, rivers, and canals, penetrating in every direction the gloom of an immense forest, which but for them were forbidden access to. New plants, new animals, and new races of men, were exhibited to view.

' Accustomed during seven years to mountains lost in clouds, I was wrapt in admiration at the wide circle embraced by the eye, restricted here by no other boundary than the horizon, save where the hills of Pongo, soon about to disappear, raised themselves to chequer the constant monotony of the scene. To the crowd of varying objects which diversify the cultured fields of Quito, and which still presented themselves to the imagination, succeeded the most uniform contrast, the whole that was to be seen being verdure and water; for the earth is so thickly covered with tufted plants and bushes, that it is trodden, but not perceived; to find a barren space, though but a foot square, requires a world of toil. Below Borja, and 400 or 500 leagues beyond, on falling down the river, a stone, nay a pebble, is an object rare as a diamond. The savages of these countries, indeed, have no conception of stones, and when on visiting Borja they first perceive them, the wonder they occasion is admirable to behold; every gesture betokens surprise; they collect them together, and load themselves with the precious burden, till, beginning to notice their abundance, they finally disregard, and throw them away.'

The first European who visited the river Amazons was Francis d'Orrelana, who, having met with some armed women or Amazons on its banks, conferred upon the river its present name. He embarked in 1539, on a river in the vicinity of Quito; and being carried by subordinate streams into the main current of the Amazons, he arrived at the North Cape, in Guiana, after a navigation of more than 5000 miles. In 1568, Pedro de Ursoa fell into this river from a tributary stream on the southern side; but he perished in the course of his voyage by the hands of his followers, who afterwards descended the stream to its mouth. It was afterwards ascended in 1638, by Pedro Texeira, whose voyage was printed, together with a chart of the course of the river. In 1707, a new chart was published by Father Fritz, who had traced the Amazon throughout its whole length; but, for want of the necessary instruments, could not fix with any degree of accuracy the position of particular points. In 1743 and 1744 it was navigated by Monsieur de Condamine, of the royal academy of sciences at Paris; who has published a correct map of its course.

A tradition long prevailed among the Spanish missionaries, that this river and the Orinoco were joined together by some of their subordinate streams, but no clear evidence was brought forward in favour of the fact, until the illustrious Humboldt, who in the course of his journeys into the interior penetrated from the Rio Negro, a branch of the Amazons already described, to the Cassiquiari, and ascending its stream arrived in the main channel of the Orinoco.

AMBA, in botany, the manga, indica, or mango tree, called also ambalam and ambe.

AMBAGES, *n.* A circuit of words; an indirect manner of expression.

Calchas led us with ambages,
That is to saine, with double wordis slic,
Such as men clepen a word with two visages.
Chaucer. Troilus & Cressida, v. 897

Epigramma in which every mery conceited man,
might, without any long studie or tedious *ambages*,
make his frend sport, and anger his foe, and give a
prettie nip, or shew a sharpe conceit in a few verses.

Puttenham. Art of Poesie, lib. 1. c. 27.

They gave those complex ideas names, that they
might the more easily record and discourse of things
they were daily conversant in, without long *ambages*
and circumlocutions; and that the things they were
continually to give and receive information about,
might be the easier and quicker understood. *Locke.*

AMBAIHLAI, or **AMBALAYA**, a large town in
the province of Delhi, 126 miles north by west from
the city of Delhi, and belonging to Sheik chiefs.
It is a walled town, and has a large citadel. The
houses are mostly built of burnt bricks, but the
streets are so narrow as scarcely to allow room
for an elephant to pass. Lat. 30°. 21'. N. long.
76°. 17'. E.

AMBA-GESHEN, a rock in Abyssinia, in the dis-
trict or independent state of Amhara of pro-
digious steepness, and almost impregnable. Its
summit is said to be about half a Portuguese
league in breadth, and the circumference at the
bottom about half a day's journey. The ascent
at first is easy; but grows afterwards so pre-
cipitous, that the Abyssinian oxen, which will
otherwise clamber like goats, must be craned up,
and let down with ropes. Here the princes of
the blood were formerly confined, a circumstance
to which Dr. Johnson so finely alludes in the open-
ing chapter of his *Rasselas, prince of Abyssinia*.

AMBAIBA, a tree in Brazil, called by the
Indians tipisca.

AMBALAM, in botany, an Indian tree, the
fruit of which is a kind of kernel that is good
to assuage pains in the ears; of the root is made
a pessary that promotes the menstrual discharge.
The bark converted into a powder is beneficial in
dysenteries, and a decoction of its wood is given
with success in gonorrhœas. *Ruit. Hist. Plant.*

AMBARVALE CARMEN, the song or prayer
used at the festival of the **AMBARVALIA**, which
see. A formula of it is preserved in *Cato, De
Re Rustica, cap. cxlii.*

AMBARVALE SACRUM, the sacrifice offered at
the Ambarvalia. See next article.

AMBARVALIA, in antiquity, a festival among
the Romans celebrated annually in honour of
Ceres, in order to procure a happy harvest. At
these feasts they sacrificed a bull, a sow, and a
sheep, which, before the sacrifice, were led in
procession thrice around the fields; whence the
feast is supposed to have taken its name; from
the Greek *αγριφι*, about; or the Latin *ambio*, I go
round; and *arvum*, a field.—Though others
write it, ambarbalia, and ambarbia, and deduce it
from *ambire urbem*, to go round the city.
From the beast offered in sacrifice, the ceremony
was also called *suvotaurilia*. The ambarvalia
were of two kinds, public and private. The
private were those solemnized by the masters of
families, accompanied with their children and
servants, in the villages and farms out of Rome.
They walked three times round the grounds,
every one being crowned with leaves of oak,
and singing hymns in honour of Ceres. After
the procession they went to sacrifice. The public
ambarvalia were those celebrated in the
boundaries of the city, and in which twelve

priests, called *fratres arvales*, officiated pontificaly, walking at the head of a procession of the citizens, who had lands and vineyards at Rome. These festivals were annual, some say twice a year, viz. in January or April, and in July or August. Some make a quinquennial ambarvalia, performed once every lustrum, or fifth year.

AMBARVALIS FLOs, in botany, a name given
by some authors to the *polygala*, or milk-
wort.

AM'BASSY, n.

AMBASSADE'

AMBAS'DOUR,

AMBAS'DRESS,

AMB'ASSAGE,

AMBAS'SATRIE,

AMBAS'SIAT.

} Low Latin, *ambascia*;
ambasciator: one who waits
or resides near the highest
authorities.

Go ye therfore as trustye *ambassadours*, and
stickyng to me your authour; teache fyrt the Jewes,
than the next nyghbours vnto them, afterwarde all
the natiōs of the whole world.

Udall. Math. cap. xxviii.

Maximilian entertained them with dilatory an-
swers; so as the formal part of their *ambassage* right
well warrant their farrer stay.

Bacon.

Give first admittance to th' *ambassadours*. *Shaksp.*
Rais'd by th' ~~ambassadour~~, I sent no news before;
Nor ask'd your leave, nor did your faith implore;
But come without a pledge, my own *ambassadour*.

Dryden.

Well, my *ambassadress*—

Come you to menace war, and loud defiance?
Or does the peaceful olive grace your brow? *Rowe.*

AMBASSADOR, or EMBASSADOR, the representa-
tive of one sovereign power to another, to
which he is sent properly accredited. The ori-
gin of the domestic management of a state, is
not the whole of government; every country has
neighbours and is obliged to look abroad, to
discover how its interests are affected by the
countries around it; to discern with sagacity in
what manner they may be either injured or best
promoted, and to take wise measures to prevent
the one, or to second the other: to accomplish
this with the fullest effect, a skilful agent seemed
necessary on the spot, to suggest views and moti-
ves, to represent the circumstances of his own
country in the most favourable light, and those
of the country to be opposed in the most un-
favourable. It was soon found that all the na-
tions in Europe had some ties of connexion, and
that the views of no one country could be mod-
elled to the purposes of another without pro-
ducing a correspondent effect on the views of all
the other countries which fell within this great
circle of connexion; the foreign politics of mod-
ern nations became in this manner very com-
plicated; each was obliged to direct its attention
not to one or a few, but to all the nations, to per-
ceive how its interests were likely to be affected
by any one. As it became necessary to transact
business of so much consequence with the rulers
or ministers of a nation's government, it was
found advisable to send men possessing high
dignity in their own nation. Thus the title of
agent was exchanged for that of ambassado^r,
and complication, finesse, and aristocracy, con-
tinued to support the title. See *Lord Chester-
field's Letters to his Son, passim*. Ambassadors

are either ordinary or extraordinary : ambassadors ordinary are those stationed at a foreign court to preserve a good understanding between the court sending them and that to which they are sent : the signing and countersigning of passports, the general protection of trade, and the transmission of intelligence, as far as it can interest their respective courts, are the chief duties of their office. Ambassadors extraordinary are those deputed on some important occasion, and are generally surrounded with superior pomp and splendour. Till within these 200 years, ambassadors in ordinary were not heard of: all, till then, were ambassadors extraordinary ; that is, such as are sent on some particular occasion, and who retire as soon as the affair is despatched. By the law of nations, none under the quality of a sovereign prince can send or receive an ambassador. The privileges of ambassadors are various. By the law of Europe, and of most civilized nations, not only the person of the ambassador is inviolate, but his whole train are exempt from the municipal law of the country where he resides. On the breaking out of a war, the ambassador, with all his attendants and property, is permitted to retire home. Notice may be given that an ambassador will not be received ; and if this be neglected, they may be taken for enemies ; but if admitted, though by enemies in arms, they are entitled to the protection of the law of nations ; and the ordinary respect paid to a flag of truce proceeds upon this principle. The Turks have, indeed, thrown ambassadors into the castle of the Seven Towers at Constantinople, on the commencement of hostilities, and even mutilated their persons ; but the porte, of late, has shewn a disposition to follow the humane usage of other courts. By statute, 7 Anne, cap. 12, an ambassador and suite is in this country protected from the consequences of arrest by the king's writs for debt ; if they are arrested, the process shall be void, and the persons suing out and executing the writ shall suffer such penalties and corporeal punishment as the lord chancellor, or either of the chief justices, shall think proper to inflict. This act originated in the following circumstance : The count de Matueof, ambassador of Peter the First of Russia, to the court of queen Anne, was publicly arrested by a laceman of London, and maltreated by the bailiffs, who dragged him from his coach to prison, where he continued until bailed by the earl of Feversham ; and neither the count nor the czar were readily to be appeased. Most of the foreign ambassadors in London joined in a protest against the insult, and Matueof retired to Holland. Anne and her ministers were much perplexed respecting the proper course to be pursued ; the parties concerned in the arrest were apprehended ; but the secretary of state acknowledged that the law of England provided no adequate punishment for the offence. Peter demanded, without hesitation, that the sheriff and all concerned should suffer death. Nor was it until an extraordinary embassy was sent, with the new act now carried through parliament, and the offer to pay all the expenses of the count, that this affair was amicably settled. There are shewn in Westminster-

abbey the unburied coffins of two foreign ambassadors, whose bodies were arrested after death. It has been enquired what violations of the criminal code of a country ought to be punished in an ambassador ? The modern usage is to consider him amenable to his own sovereign only, in all cases, excepting that of treason against the state where he resides, which is a violation of the law of nations. Instances to the contrary, however, have occurred in former times. In 1654 the brother of the Portuguese ambassador, who is said to have been jointly accredited with him to the English court, was tried, condemned, and beheaded for murder ; the only difference made between his punishment and that of some of his servants, who were also implicated, was in the mode of execution. When the duke de Sully resided at this court as ambassador of Henry IV. of France, being informed that one of his gentlemen had murdered a man at a bagnio, he sent a message to the magistrates of the city, that they might take the offender and proceed with him according to law ; but though he was tried and condemned, the British monarch thought proper to grant him a pardon and his liberty.

The ceremonies, on the reception of ambassadors, vary according to the customs of different courts. At some, an ambassador is expected not to quit his house until he has been received with all due pomp at the court to which he is sent. In China the ceremony of prostration is required on the admission of an ambassador to the presence of the emperor ; and a ninefold humiliation of this kind has been exacted ; hitherto this has been refused by British ambassadors, and sometimes at the expense of the total failure of the mission. So important is the ceremony of a due reception, that, according to the general usage of European states, no ambassador is entitled to any privilege of his office nor can he assume any of its functions, until he has been thus properly acknowledged.

At Athens, ambassadors mounted the pulpit of the public orators, and there opened their commission, acquainting the people with their errand. At Rome, they were introduced to the senate, and delivered their commissions to the senators. Ambassadors should never attend any public solemnities, as marriages, funerals, &c. unless their masters have some interest therein : nor must they go into mourning on any occasions of their own, because they represent the person of their prince.

AMBATO, ASSIENTO DE, the capital of a district of the same name in South America, which stands upon the banks of the river Ambato. It has a parish church, two chapels of ease, and a convent of Franciscans. In the year 1698 it was entirely destroyed by an eruption of Cotopaxi, which is near it, and at the same time the snowy mountain or desert of Carguairaso, throwing up a river of mud and lava, inundated the whole country. The monuments of this misfortune are still visible ; the town, however, now flourishes. It is eighteen leagues from Quito, and four from Tarunga. The river Ambato is amazingly violent in its stream and forms one of the tributaries to the Patate.

AMBAZAC, a town of France, in Limousin, the head of a canton in the department of Upper Vienne and arrondissement of Limoges, four leagues north-north-east of the last place. It contains 2800 inhabitants.

AMBE, in anatomy, a superficial jetting out of bone.

AMBE, in botany. See **AMBA**.

AMBE, in surgery, an ancient instrument, with which they reduced dislocated bones. The ambe, or commander, is mentioned by Hippocrates, and has its partizans among the moderns, especially for replacing the arm. But it is only useful in luxations directly downwards, and even in these is dangerous. M. Le Cat has endeavoured to remedy its defects. See *Phil. Trans. N. 469.*

AM'BER, *v. n. & adj.* German, *amberen*, *anbernen*, or *unbrennen*; to burn, to kindle.

Yet neuer eye to Cupid's seruice vow'd
Beheld a face of such a louely pride,
A tinsell vaille her amber locks did shroud,
That stroue to couer what it could not hide.

Fairfax's Tasso, book iv.

Thy belt of straw and ivy bads,
Thy coral clasps and amber studs;
All these in me no means can move,
To come to thee and be my love.

Sir Walter Raleigh, in *Ellis*, v. ii.

Fresh roses bring

To strew my bed, 'till the impoverish'd spring
Confess her want; around my amorous head
Be dropping myrrh and liquid amber shed,
'Till Arab has no more. *Prior's Solomon*, b. ii.

Say, will no white-rob'd son of light,
Swift-darting from his heav'nly height,

Here deign to take his hallow'd stand;

Here wave his amber locks; unfold

His pinions, cloth'd with downy gold;

Here smiling stretch his tutelary wand?

Mason's Elfrida.

If light penetrateth any clear body that is coloured, as painted glass, *amber*, water, and the like, it gives the light the colour of its medium. *Peacham*.

No interwoven reeds a garland made,
To hide his brows within the vulgar shade;
But poplar wreaths around his temple spread,
And tears of *amber* trickled down his head. *Addison*.

The spoils of elephants the roofs inlay,
And studded *amber* darts a golden ray. *Pope*.

AMBER, or **AMBEER**, a town in the province of Ajmeer, district of Jyenagur, or Jeypoor Hindostan. It was formerly the capital of the district; until Mirza Rajah Jeysing, in the reign of Aurengzebe, built a new city named Jeypoor, since which time the rajahship has taken that name also. Lat. 26°. 58'. N. long. 73°. 53'. E. See **JYENAGUR**.

AMBER, from *amber*, or *ambra*, Arab. amongst naturalists, has been defined a solid, hard, semi-pellucid, bituminous substance of a particular nature, of use in medicine, and in several of the arts, and called *electrum* by the Greeks. Amber has a resinous taste, and smells like oil of turpentine; it is chiefly found in the Baltic sea, along the coasts of Prussia. Some naturalists refer its origin to the vegetable, others to the mineral, and some even to the animal kingdom. Pliny describes it as a resinous juice, oozing from aged pines and firs, and discharged thence into the sea. He adds, that it was hence

the ancients gave it the denomination of *succinum*, from *succus*, juice. But as good amber has been found in digging at a considerable distance from the sea as that gathered on the coast. Boerhaave ranks it with camphor, which is a concrete oil of aromatic plants, elaborated by heat into a crystalline form. Within some pieces of amber have been found leaves, and insects included; which seems to indicate, either that the amber was originally in a fluid state, or that, having been exposed to the sun, it was softened, and rendered susceptible of the leaves and insects. Amber, when rubbed, draws or attracts bodies to it; and, by friction, is brought to yield light pretty copiously in the dark. Some have distinguished amber into yellow, white, brown, and black; but the two latter are supposed to be of a different nature and denomination; the one called jet, the other ambergris. Liquid amber is a kind of native balsam or resin, like turpentine; clear, reddish, or yellowish; of a pleasant smell, almost like ambergris. It flows from an incision made in the bark of a fine large tree in New Spain, called by the natives ososol. The colour of amber is generally some shade of yellow, as wine, wax, or honey-yellow, honey-red, yellowish-white; it is also found occasionally green or brown. It occurs amorphous, and in detached pieces, more or less shining, with a waxy lustre. Its fracture is conchoidal, and when broken it flies into indeterminate, not particularly sharp, fragments. It is commonly transparent, more rarely semi-transparent or translucent. It is brittle, and its specific gravity varies from 1.065 to 1.1. By rubbing, it readily becomes electric. When applied to a lighted candle it takes fire, swells considerably, but does not run into drops, and exhales a white smoke of a pungent penetrating odour. From its Greek name *ηλεκτρον*, the important science of electricity received its name.

Amber has been of great repute in the world from the earliest times. Many years before Christ it was in esteem as a medicine; and Plato, Aristotle, Herodotus, Aeschylus, and others, have commended its virtues. Theophrastus wrote expressly upon the subject, about A. A. C. 300. In the times of the Romans it became in high esteem as a gem; and in the luxurious reign of Nero, immense quantities of it were brought to Rome, and used for ornamenting works of various kinds. It was greatly esteemed among the Goths, their king Theodore being very fond of it. The phenomena of insects found in amber can only be accounted for from their being attracted by its flavour; for those insects are never found in the centre of the pieces of amber, but always near the surface. It is observed by the inhabitants of those places where amber is produced, that all animals, whether terrestrial, aerial, or aquatic, are extremely fond of it, and that pieces of it are frequently found in their excrements. The bodies of insects found buried in amber have been long admired; but of the most remarkable of these, many are to be suspected as counterfeit, the great price at which beautiful specimens of this kind sell having tempted ingenious cheats to introduce animal bodies in such an artful manner into seemingly whole

pieces of amber, that it is not easy to detect the fraud. Of those which have been originally enclosed in amber, some are plainly seen to have struggled hard for their liberty. This also may account for the common accident of finding legs, or wings of flies, without the rest of their bodies, in pieces of amber; the insects having, when entangled in the yet soft and viscid matter, escaped at the expense of leaving those limbs behind them. Drops of clear water are sometimes also preserved in amber. These have doubtless been received into it while soft, and preserved by its hardening around them. Beautiful leaves of a pinnated structure, resembling some of the ferns, or maiden-hairs, have been found in some pieces; but these are rare, and the specimens of great value. Mineral substances are also found at times lodged in masses of amber. Some of the collections of the German princes boast of specimens of native gold and silver in masses of amber; but as there are many substances of the marcasite, and other kinds that have all the glittering appearance of gold and silver, it is not to be too hastily concluded that these metals are really lodged in these beds of amber. Iron is found in various shapes immersed in amber; and as it is often seen eroded, and sometimes in the state of vitriol, it is not impossible but that copper, and the other metals, may be also sometimes immersed in it in the same state: hence the bluish and greenish colours, frequently found in the recent pieces, may be owing, like the particles of the gem colours, to those metals; but as the gems, by their dense texture, always retain their colours, this lighter and more lax bitumen usually loses what it gets of this kind by being kept. Small pebbles, grains of sand, and fragments of stones, are also found immersed in amber. Naturalists have been greatly divided as to the origin of this substance, and what class of bodies it belongs to. Some suppose amber a compound substance. Prussia, say they, and the other countries which produce amber, are moistened with a bituminous juice, which, mixing with the vitriolic salts abounding in those places, the points of those salts fix its fluidity, whence it congeals; and the result of that congelation makes what we call amber; which is more or less pure, transparent, and firm, as those parts of salt and bitumen are more or less pure, and are mixed in this or that proportion. Brydone, in his tour to Sicily and Malta, says, that the river Gearetta, formerly celebrated by the poets under the name of Simetus, throws up near its mouth great quantities of amber. He mentions also a kind of artificial amber, not uncommon there, made, as he was told, from copal, but very different from the natural. According to Hartman, amber is formed of a bitumen mixed with vitriol and other salts. But though this were allowed him in regard to the fossil amber, many dispute whether the sea-amber be so produced. It is, however, apparent, that all amber is of the same origin, and probably that which is found in the sea has been washed thither out of the cliffs; though Hartman thinks it very possible that some of it may be formed in the earth under the sea, and be washed up thence. The sea-amber is usually finer to the eye than the

fossil; but the reason is, that it is divested of that coarse coat with which the other is covered while in the earth. Upon the whole, it seems generally agreed upon, that amber is a true bitumen of fossil origin.—In a late volume of the Journal de Physique, however, we find it asserted by Dr. Girtanner to be an animal product, a sort of honey or wax, formed by a species of large ant called by Linnaeus *formica rufa*. These ants, he says, inhabit the old pine forests, where they sometimes form hills about six feet in diameter; and it is generally in these ancient forests, or in places where they have been, that fossil amber is found. This substance is not so hard as that which is taken up in the sea at Prussia, and which is well known to naturalists. It has the consistence of honey or of half-melted wax, but it is of a yellow colour like common amber; it gives the same product by chemical analysis, and it hardens like the other when it is suffered to remain some time in a solution of common salt. This accounts for the insects that are so often found enclosed in it. Among these insects ants are always the most prevailing; which tends farther, Dr. Girtanner thinks, to the confirmation of his hypothesis. Amber then, in his opinion, is nothing but a vegetable oil rendered concrete by the acid of ants, just as wax is nothing but an oil hardened by the acid of bees; a fact incontestably proved, we are told, by Mr. Metheries, who has made artificial wax by mixing oil of olives with the nitrous acid, which wax is not to be distinguished from the natural. In the second volume of the Edinburgh Philosophical Journal, Dr. Brewster has given an account of some optical properties of amber, from which he considers it established beyond a doubt that amber is an indurated vegetable juice; and that the traces of a regular structure, indicated by its action upon polarized light, are not the effect of the ordinary laws of crystallization by which mellite has been formed, but are produced by the same causes which influence the mechanical condition of gum arabic, and other gums, which are known to be formed by the successive deposition and induration of vegetable fluids.

There are several indications which discover where amber is to be found. The surface of the earth is there covered with a soft scaly stone; and vitriol in particular always abounds there, sometimes white, sometimes reduced into a matter like melted glass, and sometimes figured like petrified wood. Amber of the finest kind has been found in England. It is frequently thrown on the shores of Yorkshire and many other places, and found even in our clay pits; the pits dug for tile-clay, between Tyburn and Kensington gravel pits, and that behind St. George's Hospital at Hyde Park Corner, have afforded fine specimens. Poland, Silesia, and Bohemia, are famous for the amber dug up there at this time. Germany affords great quantities of amber, as well dug up from the bowels of the earth, as tossed about on the shores of the sea and rivers there. Saxony, Misnia, and Sweden, and many other places in this tract of Europe, abound with it. Denmark has afforded, at different times, several quantities of

fossil amber; and the shores of the Baltic abound with it. But the countries lying on the Baltic afford it in the greatest abundance; and of these the most plentiful country is Prussia, and the next Pomerania. Prussia was, as early as the times of Theodoric the Goth, famous for amber; for this substance coming into great repute with this prince, some natives of Prussia, who were about his court, offered to go to their own country, where that substance, they said, was produced, and bring back great store of it. They accordingly did so; and from this time Prussia was the Country of Amber, instead of Italy, which had before undeservedly that title. Junker describes, after Neumann, the Prussian amber mines, which are the richest known: First, at the surface of the earth, is found a stratum of sand. Immediately under this sand is a bed of clay, filled with small flints about an inch diameter each. Under this clay lies a stratum of black earth, or turf, filled with fossil wood, half decomposed, and bituminous; this stratum is extended upon a bank of minerals, containing little metal, except iron, which are consequently pyrites. Lastly, under the bed the amber is found, scattered about in pieces, or sometimes accumulated in heaps.

Its chemical properties have been as yet but little examined. According to Hoffmann, one part of powdered amber, and two of oil of almonds, are capable of combining with each other into a clear gelatinous mass, by being moderately heated for about an hour in a Papin's digester. It is also, according to the same author, totally soluble in caustic potash. Alcohol extracts the colouring part with some resin, but is not a complete solvent. It is said also, that sulphuric acid is a menstruum for amber, but probably not without considerably changing its properties. When exposed to dry distillation in a glass retort, it melts and swells greatly, and gives out first a watery acid liquor, smelling strongly of amber, then a concrete acid salt which crystallizes in yellowish needles in the neck of the retort, and is the succinic acid; after which there passes a light coloured odorant oil, which, as the distillation goes on, becomes of a darker colour and thicker consistence; a small quantity of the acid also rises at the same time. When all the volatile parts are thus separated, there remains in the retort a spongy intensely black shining coal, the basis of the fine black varnish. The oil is afterwards rectified by distillation with water, when only the light fragrant colourless part comes over. The relative proportions of oil and acid vary according to the purity of the amber used, and the care of the operator. From sixteen ounces of the common dark brown amber of the shops, Neumann obtained eleven ounces six drachms of oil, four drachms and a half of acid, an ounce and a half of acidulous water, and about an ounce of carbonaceous residue. From thirty-two ounces of the small granular kind, or sandstein, he obtained nine drachms of acid, and twenty-four ounces of oil. The specific gravity of amber is from 1.065 to 1.100. When it melts it yields an agreeable smell, and projected on burning coals, burns with a whitish flame and a whitish yellow smoke, gives little soot, and leaves brownish ashes. Amber is said

to be the basis of all varnishes by solution, but when once melted irrecoverably loses its beauty and hardness. Some have, however, pretended they had an art of melting some small pieces of amber into a mass, and constituting a large one of them: but this seems such another undertaking as the making of gold; all the trials that have yet been made by the most curious experimenters, proving that the heat which is necessary to melt amber is sufficient to destroy it. See Phil. Trans. N^o. 248. Hartman indeed mentions a phenomenon which shows the possibility of many pieces of amber being combined into one, by an operation of nature, though it cannot be effected by art. A sheep, he says, was once killed in Prussia, in whose stomach was found a large piece of amber, which was composed of several other smaller pieces, the joinings of all which were visible, though as firm as the pieces themselves. This showed the animal had swallowed the amber in small pieces with its food, and that nature, by the heat and juices of its stomach, had softened those pieces without melting them, in such a manner as to make them unite firmly, though not blended together. Amber has been much used and recommended in medicine for its nervous and cordial qualities, also for promoting the menstrual discharge, expulsion of the fetus, &c. as an antidote for spasms, and preservative against the pestilence; but many of its supposed qualities are at least questionable.

AMBER, OIL OF, a fine, transparent, ponderous, yellow oil, procured from amber, by increasing the heat after the spirit is obtained. See next article. It is reckoned a good anti-hysteric and anti-spasmodic.

AMBER, SPIRIT OF, an acid liquor, procured from amber by pulverizing and distilling it with a sand heat. It is chiefly used in rheumatic pains externally, and in inveterate gleet internally.

AMBER-TREE, in botany, frutex Africanus ambram spirans. A shrub whose beauty is in its small ever-green leaves, which grow as close as heath, and, being bruised between the fingers, emit a very fragrant odour. We shall here only observe, that this is one of several genera of plants, which afford a decisive evidence of the truth of the Linnaean or sexual system of botany; as the male and female flowers grow on different plants, which when separated cannot propagate, more than animals of different sexes separated from each other. For many years there were only a few male plants of this shrub in our gardens, which were continued by cuttings, till seeds of the female plant were imported from the Cape of Good Hope, when plants of both sexes were raised. See ANTHOSPERMUM.

AMBER, VOLATILE SALT OF, is the principal chemical production of amber. It is a peculiar acid salt, which rises after the oil, and fixes in the neck of the retort. Mr. Potts concludes, from various experiments, that the acid of this salt is essentially different from the mineral acids, and approaches nearest to those of the vegetable kingdom. It is a good cephalic and detergent; and Quincy says, it attenuates, cuts, and pene-

trates, the most remote and minute recesses; and thus scourts, as it were, the whole nervous system. Its chief tendency, he adds, is to secretion; and what it carries off, is by urine. It also contributes to promote a diaphoresis, and is prescribed in chronic cases, as palsies, and epilepsies. It is often adulterated with sal ammoniac, nitre, and cream of tartar, &c.

AMBER LIQUID. See BALSAM.

AMBERG, a city of Germany, formerly the capital of the upper palatinate of Bavaria, with a good castle, armory, ramparts, bastions, and deep ditches; several beautiful walks are now made in and about the latter. It is seated near the confines of Franconia, on the river Ills, or Wills, 40 miles east of Nuremberg, and 32 north of Ratisbon, is divided into the upper and lower towns, and it drives a great trade in iron and other metals found in the neighbouring mountains. Population about 9000. The houses though mostly of wood are well-built, and the streets broad and clean. The principal square in the middle of the town is regular and even beautiful. In it stands the old Gothic town-house, and the splendid parish church of St. Martin. There is here an academy and lyceum, a well-endowed hospital and several religious houses. A convent of very respectable nuns, founded by the electress Maria in 1692, maintains a public school for young girls and has a new and noble church. Among the other edifices may be noticed the electoral (now royal) castle, the arsenal, the government buildings (where the colleges of justice and finance had their sittings), and the mint, reckoned one of the finest in Germany. The manufactures are those of fire-arms, earthen-ware, tobacco, and iron; and there is a good trade in salt. The district to which the town gives name contains on an extent of 187 square miles, 13,339 inhabitants, exclusive of the town. Amberg was taken by the Austrians in 1743, and by the French in 1796.

AMBERGREASE KEY, an island in the bay of Honduras, northward of the British settlement of Belize. It is upwards of 70 miles in length, but very narrow, abounding with game, and diversified with numerous fresh water lakes. No constant settlement of any consideration has ever been made on it, but it is a place of agreeable resort, in the hot months, to the settlers on the neighbouring continent. The brasiletto, logwood, and other dyeing woods abound here. See HONDURAS.

AMBERGRIS, AMBERGREASE, or GREY AMBER, is described by natural historians as a fatty inflammable substance, variegated like marble, remarkably light, rugged and uneven in its surface, and having a fragrant odour when heated; which increases as it grows older, or when it is mixed with musk, or other aromatics, as is done in preparing perfumes or odoriferous waters. It does not effervesce with acids; it melts freely over the fire into a kind of yellow resin; and is hardly soluble in spirit of wine. It is found swimming upon the sea, or the sea-coast, or in the sand near the sea-coast; especially in the Atlantic ocean, on the sea-coast of Brazil, and that of Madagascar; on the coast of Africa, of the East Indies, China, Japan, and the Molucca

Islands; but most of the ambergris which is brought to England comes from the Bahama islands, from Providence, &c. where it is found on the coast, as well as in the abdomen of whales by the whale-fishermen, in lumps of various shapes and sizes, weighing from half an ounce to 100 pounds or more. An American fisherman from Antigua found, some years ago, about fifty-two leagues south-east from the Windward Islands, a piece of ambergris in a whale, which weighed about 130 pounds, and sold for £500 sterling. Lumps are sometimes formed of near 200 pounds weight. The inhabitants of the Samballas search for ambergris in a singular manner. They hunt it by the scent; after a storm they run along the shore, and if any ambergris be thrown up they discover it by the smell. There are certain birds and other animals on those coasts that are very fond of ambergris, and attracted from a distance by its scent. There are various suppositions and theories as to the nature of this substance, whether it belongs to the vegetable, mineral (for it is found adhering to rocks washed by the sea), or to the animal kingdom. By many it has been considered as a bitumen, a sort of petroleum issuing from the rocks, and condensed by the action of the sun and the water of the sea. Others have imagined it to be made up of the excrements of birds nourished on odoriferous herbs; and by some it has been taken for a sea-mushroom, torn up from the bottom by the violence of tempests. Others, again, have ascribed its origin to the froth thrown out by sea-calves, the excrements of the crocodile, &c. Some maintain that ambergris is made from the honey-combs, which fall into the sea from the rocks, where the bees had formed their nests; several persons having seen pieces that were half ambergris and half plain honey-comb; and others have found large pieces of ambergris, in which, when broken, honey-comb and honey too were found in the middle.

Pommel and Lemery thought it a mixture of wax and honey, hardened by the action of the sun, and altered by the sea water. M. Formey, who has adopted this opinion, supports it by an experiment which consists in digesting wax and honey: he asserts, that a product may thus be formed of an agreeable smell, nearly the same with that of ambergris. Some authors have considered ambergris as an animal juice, deposited in bags situated near the root of the genital organ in the male whale; and others have imagined that it is formed in the bladder of that cetaceous animal: but the nebs of cuttle-fishes found in this concrete juice are sufficient to confute these opinions. The most probable opinion, and which has of late obtained the most general admission, is that of Dr. Schwedauer, who, after examining a great many specimens of this substance, and receiving accounts concerning it from different navigators, has concluded it to be formed in the alimentary canal of the phyceter macrocephalus, or spermaceti whale. He considers ambergris as an excrement of this cetaceous animal, mixed with some parts of its food, 1. Because fishermen find it in these whales; 2. Because it is common in the lati-

tudes which they inhabit; 3. Because beaks of the cuttle-fish with eight feet, *sepia octopoda*, on which that animal lives, are always found in it; 4. Because he distinguished the black spots mixed through ambergris to be the nebs of this polyous animal; Lastly, because the excrements of several quadrupeds, as cows, hogs, &c. exhale an odour similar to that of ambergris, when kept for any length of time.

Ambergris when taken from the whale is not so hard as it becomes afterward on exposure to the air. Its specific gravity ranges from 780 to 926. If good, it adheres like wax to the edge of a knife with which it is scraped, retains the impression of the teeth or nails, and emits a fat odoriferous liquid on being penetrated with a hot needle. It is generally brittle; but on rubbing it with the nail it becomes smooth like hard soap. Its colour is either white, black, ash-coloured, yellow, or blackish; or it is variegated, namely, grey with black specks, or grey with yellow specks. Its smell is peculiar, and not easy to be counterfeited. At 144° it melts, and at 212° is volatilized in the form of a white vapour: but on a red-hot coal it burns, and is entirely dissipated. Water has no action on it; acids, except nitric, act feebly on it; alkalies combine with it, and form a soap; ether and the volatile oils dissolve it; so do the fixed oils, and also ammonia, when assisted by heat; alcohol dissolves a portion of it, and is of great use in analyzing it. When distilled, it yields an aqueous phlegm, a brown-coloured acidulous spirit, a deeper-coloured oil, a thick balsam, and, as some say, a volatile salt, leaving a black shining residuum. The spirit, oil, balsam, and salt, are similar to those obtained from amber; but the oil is of a more grateful smell. Its chemical products resemble those of bitumens, among which it has been ranked.

According to Bouillon la Grange, who has given the latest analysis of it, 3820 parts of ambergris consist of adipocere 2016 parts, a resinous substance 1167, benzoic acid 425, and coal 212. Buchholz found no benzoic acid in it; but two different specimens examined by Dr. Ure exhibited a difference in this respect. The one yielded benzoic acid; the other, equally genuine to all appearance, afforded none.

Ambergris, in a medical view, is stomachic, cordial, and antispasmodic. In Asia, and part of Africa, it is used not only as a perfume and a medicine, but as an article of cookery; in which it is added to dishes in lieu of all-spice. A great quantity of it is bought by the Mecca pilgrims, probably to use it for the purpose of fumigation and sacrifice. With us its use is chiefly confined to perfumers, who melt it over a gentle fire, and make extracts, essences, and tinctures of it; they also use it to scent pillows, candles, balls, bottles, gloves, and hair-powder. As ambergris is very dear, it is counterfeited and mixed with different substances. It may be known to be genuine by its fragrant scent, when a hot needle or pin is thrust into it, and its melting like fat, of a uniform consistence; it swims also on water when pure, and does not stick to hot iron.

AMBERICA or ST. GERMAIN D'AMBERIEUV.

a town of France, the head of a canton in the department of the Ain, arrondissement of Bellay, $\frac{1}{2}$ leagues from Bourg. Population 2900.

AMBERT, a town of France, in the department of Puy-de-Dôme, the head of an arrondissement, seated in a beautiful valley on the river Ore, 21 miles east of Issoire, and 300 from Paris. It was the chief town of the ci-devant territory of Livradois. An extensive manufacture of paper is carried on in it; as well as of camblets, ferrets, coarse laces, &c. Lon. 3°. 50'. E. lat. 45°. 25'. N. Population 5500.

AMBIANENSIS CIVITAS, or AMBIANI, now Amiens, a city of ancient Gaul. It is called Samarobriva by Cæsar and Cicero; which, according to Valesius, signifies the bridge of the Samara or Somme. Ambiani is a later name, taken from that of the people, after the usual manner of the lower age. See AMIENS.

AMBIDEXTER, n. { Lat. *ambo*, *dexter*;

AMBIDEX TROUS. { *αριθδεξιος*; both hands right. One who uses the left hand equally with the right. One who will act with readiness on both hands, or with either party.

Some are *ambidexterous* or right-handed on both sides; which happeneth only unto strong and athletical bodies, where heat and spirits are able to afford an ability unto both. Brown's *Vulgar Errors*.

Others not considering *ambidextrous* and left-handed men do totally submit unto the efficacy of the liver. Brown

Aesop condemns the double practices of trimmers, and all false, shuffling, and *ambidextrous* dealings. L'Estrange.

AMBIDEXTER. Various conjectures, or rather chimeras, have been offered with respect to the causes of ambidexterity. Some have thought, that were it not for education and habit, all mankind would be ambidexters; and, in fact, we frequently find nurses obliged to take much pains before they can bring children to forego the use of their left hands. How far it may be an advantage to be deprived of half our natural dexterity, may be doubted. It is certain, there are many occasions in life, when it would be better to have the equal use of both hands. Surgeons and oculists are of necessity obliged to be ambidexters; bleeding, &c. in the left arm, or left ankle, and operations on the left eye, cannot be well performed but with the left hand; and instances occur in history, where the left hand has been exercised preferably to the right. By the laws of the ancient Scythians, people were enjoined to exercise both hands alike; and Plato enjoins ambidexterity to be observed and encouraged in his republic. In the German armies formerly, the more distinguished soldiers, their pikemen, and halberdiers, as well as those who formed the first line of the battalions, were trained to be able to fight equally with the left hand or the right. We find it mentioned in scripture, that on an extraordinary occasion, the single tribe of Gad produced 700 brave men, who fought with the left hand as well as the right, Judges xx. 16; David had also slingers and archers of this description, 1 Chron. xii. 2; and the Roman historians inform us, that they had gladiators who were trained to ambidexterous combats. An ingenious French writer is

surprised, that among all the modern refinements in the art of war, none have thought of restoring the ancient practice of training ambidexters, who undoubtedly might be of service in cases of stratagem.

AMBIEGNA Bos, in antiquity, an ox; so named by the augurs because it had the other victims around it. *Varro de Ling. Lat. I. 6, c. 3.*

AMBIENT, *adj.* { Lat. *ambio*; *ambiens*: AM'BIT. { *am*, corruption of the Gr. *apo*, around, and *ire* to go. Going round, surrounding or encircling.

This which yields or fills
All space, the ambient air wide interfus'd.

Milton.
The thickness of a plate requisite to produce any colour, depends only on the density of the plate, and not on that of the ambient medium. *Newton's Optics.*

Around him dance the rosy hours,
And damasking the ground with flow'rs,
With ambient sweets perfume the morn.

Fenton to Lord Gower.

Illustrious virtues, who by turns have rose
With happy laws her empire to sustain,
And with full pow'r assert her ambient main.

Prior.
The ambient aether is too light and empty to impel horizontally with that prodigious celerity.

Bentley.

Around the circle of their ambient skies,
New moons may grow or wane, may set or rise.

Prior's Solomon.

The tusk of a wild boar winds about almost into a perfect ring or hoop; only it is a little writhen. In measuring by the *ambit*, it is long or round about a foot and two inches; its basis an inch over.

Grew's Museum.

AMBIGENÆ OVES, in the heathen sacrifices, an appellation given to such ewes as, having brought forth twins, were sacrificed together with their two lambs, one on each side. We find them mentioned among other sacrifices of Juno.

AMBIGENAL HYPERBOLA, a name given by Sir Isaac Newton to one of the triple hyperbolas of the second order, having one of its infinite legs falling within an angle formed by the asymptotes, and the other without.

AMBIGUITY, *n.* Lat. *ambigo*: from *am* { *ambig'ous*, for *apo* around, and *ago* { *ambig'uously*. To drive. Ambiguity denotes confusion and doubt; going this way and that way for want of knowing the right direction; at a loss.

We can clear these *ambiguities*,
And know their spring, their head, their true descent.

Shakespeare.

The words are of single signification, without any *ambiguity*; and therefore I shall not trouble you, by straining for an interpretation, where there is no difficulty; or distinction, where there is no difference.

South.

But what have been thy answers, what but dark,
Ambiguous, and with doubtful sense deluding?

Milton.

Th' *ambiguous* god, who rul'd her lab'ring breast,
In these mysterious words his mind exprest;
Some truths reveal'd in terms, involv'd the rest.

Dryden.

Some expressions in the covenant were *ambiguous*, and were left so, because the persons who framed them were not all of one mind. *Clarendon.*

Silence at length the gay Antinous broke,
Constrain'd a smile, and thus *ambiguous* spoke.
Pope.

Simplicity apace,
Tempers his rage, he owns her charms divine,
And clears th' *ambiguous* phrase, and lops the unwieldy line.
Beattie's Minstrel.

AMBIT. See AMBIENT.

AMBIT, in antiquity, was used to denote a space of ground to be left vacant betwixt one building and another. By the laws of the twelve tables, houses were not to be built contiguous, but an ambit or space of two feet and a half was to be left about each for fear of fire. The ambitus of a tomb or monument denoted a certain number of feet, in breadth and length, around the same, within which the sanctity assigned to it was limited. It was usual to inscribe the ambit on it, that it might be known how far this sanctity extended; as 'in fronte pedes tot, in agrum pedes tot.'

AMBIT, in geometry, is the same with what is otherwise called the perimeter of a figure. See PERIMETER.

AMBITION, *n.* { *Ambio*, to go round;
AMBIT'IOUS, { *am* and *eo*. A going about
AMBIT'IOUSLY, { to solicit places of honour.
AMBIT'IOUSNESS. A strong desire of honours and glory.

How divine a thing is knowledge, whereof even innocency itself is *ambitious!* *Hall's Contemplations.*

For wild *ambition* like a ravenous wolf,
Spur'd on by will, and seconded by power,
Must make an universal prey of all,
And last devour itself.

Dryden's Troilus and Cressida.

The neighb'ring monarchs, by thy beauty led,
Contend in crowds, *ambitious* of thy bed:
The world is at thy choice, except but one,
Except but him thou canst not choose alone.

Dryden.

The grandeur and beauty of the soul charm us universally, who have all of us implanted in our bosoms, even in the midst of misery, passions of high descent, immense *ambition*, and romantic hopes.

Usher.

Contest begets aversion: a little success inspires more *ambitious* hopes. *Cowper's Letters.*

The quick'ning power would be, and so would rest,
The sense would not be only, but be well:

But wit's *ambition* longeth to the best,
For it desires in endless bliss to dwell. *Davies.*

No nation was ever governed by a conqueror that did not suffer by his *ambition*.

Hawkesworth's Telemachus.

No, freedom, no, I will not tell
How Rome before thy face,
With heaviest sound, a giant-statue fell,
Push'd by a wild and artless race,
From off its wide *ambitious* base.

Collins' Ode to Liberty.

AMBITION is generally used in a bad sense, for an immoderate or illegal pursuit of power or honour. In the literal, and perhaps original meaning, however, of the word, it signified the same with the ambitus of the Romans. See AMBITUS. Ambition, in the former and more usual sense, is a passion that can never be satis-

fied. It swells gradually with success, and every acquisition serves but as a spur to farther pursuits. Yet Dr. Young has justly styled ambition, or the love of fame, the universal passion. In this enlarged view, we would define ambition to be—a desire of excelling, or at least of being thought to excel, our neighbours in any thing. This definition, we apprehend, will apply to ambition in every point of view, whether its objects are good or bad—laudable or the contrary. It was represented, in ancient hieroglyphics, as a young man clad in green, and crowned with ivy, about to climb a steep ascent, at the top of which appeared crowns and sceptres. He had a lion by his side to denote that fortitude which should be the companion of ambition.

AMBITIOSI. See AMBITUS.

AMBITUS. *ἀμφι, εώ: ambitus,* Lat. Derived from the custom of candidates surrounding those whose suffrages they sought. Seeking the favour or interest exemplified by the English practice of canvassing a town or county previously to an election.

AMBITUS, in antiquity, the setting up for some magistracy or office, and formerly going round the city to solicit the interests and votes of the people. Ambitus differed from ambition, as the body does from the soul; the former being the act, or effect; the latter the exciting cause existing in the mind. It was of two kinds; one lawful, the other infamous. The first, called ambitus popularis, was when a person offered his service to the republic frankly, leaving it to every body to judge of his pretensions as they found reasonable. The means and instruments here made use of were various: 1. Amici, or friends, under different relations, including cognati, affines, necessarii, familiares, vicini, tribules, clientes, municipes, sedales, collegae. 2. Nomenclatura, or the calling and saluting every person by his name; to which purpose the candidates were attended with an officer, under the denomination of interpres, or nomenclator. 3. Blanditia; or obliging persons, by serving them, or their friends, patrons, or the like, with their vote and interest on other occasions. 4. Prensatio; the shaking every person by the hand, offering him his service, friendship, &c. The second kind was that wherein force, cajoling, money, or other extraordinary influence, was made use of. This was held infamous, and severely punished, as a source of corruption and other mischiefs. Ambitus was practised not only at Rome and the forum, but in the meetings and assemblies of other towns in Italy, where numbers of citizens were usually found on account of trade and business. The practice ceased in the city from the time of the emperor, as posts were no longer to be had by courting the people, but by favour from the prince. Ambitus was also shamefully practised by persons who had causes depending, going about among the judges to implore their favour and mercy. They who practised this were called ambitiosi. Hence, we also meet with ambitiosa decreta, and ambitiosa iussa, used for such sentences and decrees as were thus procured from the judges, contrary to reason and equity, either gratuitously or for money.

AMBITUS, in music, signifies the particular extent of each tone, or modification of grave and sharp.

AMBIX, in ancient writers, denotes a vessel of glass or shell. Hence the origin of the word alembic, which we sometimes also find denoted by the word ambix.

AMBLAW, AMBLOO, or BELAW, one of the Molucca islands, about fifteen miles in circumference. It is but thinly peopled, and dependent on Amboyna. The Papuas plundered it about the year 1765, and carried off all the inhabitants. Fine shells are found on the shore. Distant two leagues south of Bouro. Long. 127°. 0' east. lat. 3°. 55' south.

AM'BLE, v. Lat. *ambulare*, to walk. App'LED, **AM'BLING,** plied to a horse which goes a gentle pace, distinct from trotting.

This markis hath hire spoused with a ring
Brought for the same cause, and than hire sette
Upon an hors snow white, and well ambling.
Chaucer. The Cleke's Tale.

Who *ambles* time withal?—A rich man that hath not the gout; for he lives merrily, because he feels no pain; knowing no burden of heavy tedious penury: him time *ambles* withal.
Shakespeare's As you like it.

It is good, on ~~all~~ the occasions, to enjoy as much of the present, ~~but~~ not endanger our futurity; and to provide ourselves of the virtuoso's saddle, which will be sure to *amble*, when the world is upon the hardest trot.
Dryden.

A laughing, toying, wheedling, whimpering she,
Shall make him *amble* on a gossip's message,
And take the distaff with a hand as patient
As e'er did Hercules.
Rowe's Jane Shore.

Frequent in park with lady at his side,
Ambling and Prattling scandal as he goes;
But rare at home, and never at his books,
Or with his pen, save when he scrawls a card.
Couper's Task, book ii.

AMBLESIDE, a town of England, in the county of Westmoreland, situated on a declivity near the banks of Windermere lake. Here is a considerable manufactory of woollen cloth, which is sent to Kendal, thirteen miles distant. The place is supposed to have been the Dictus of the Romans. Distance from London 274 miles north.

AMBLÉEUSE, a maritime town of France, in Picardy; formerly in the Boulonnois, now in the department of the Pas de Calais, arrondissement of Boulogne. It has a fort and a harbour, which was ruined by the English in the 17th century, and is remarkable as being the place where James II. landed, after his abdication in 1668, four miles south of Boulogne.

AMBLOYSIS, in midwifery, ABORTION, which see.

AMBLOTICS, *ἀμβλωτικα*, Gr. medicines that cause abortion.

AMBLYGON, from *ἀμβλυγόν*, obtuse, and *γωνία*, angle: in geometry, denotes an obtuse-angled triangle, or a triangle one of whose angles consists of more than ninety degrees.

AMBLYGONITE, in mineralogy, a pale-green mineral, marked superficially with reddish and dark yellow spots. It is found massive, and crystallized, in oblique four-sided prisms; is of a vitreous lustre, fracturing uneven, and the fragments rhomboidal.

AMBLYOGMOS and **AMBLYOPIUS**, in medicine, *ἀμβλυωγμός*, a word frequently used by Hippocrates for dimness of sight.

AMBO. *Αμβωνία*, whatever rises up or projects: an elevated place in churches, distinct from the pulpit and reading desk, formerly used in churches, some of which are still standing, for the purpose of chanting and preaching to the people.

Between the *Τροποτάροις* and the faithful, stood the *ambo*, or reading desk.

Sir G. Wheeler's *Acct. of the Chur. of Prim. Chris.*

The principal use of this *ambo* was, to read the scriptures to the people, especially the epistles and gospels. They read the gospel there yet, and not at the altar.

Id.

AMBO, or **AMBON**, from *ἀναβαῖνειν*, to mount, or *anbo*, the admission to it being from both sides: a kind of pulpit, or desk, in the ancient churches where the priests and deacons stood, to read or sing part of the service, and preach to the people; called also *analogium*. The *ambo* was ascended by steps; which occasioned that part of the office performed there to be called the *Gradual*. See *GRADUAL*. At the top of the *ambo* the gospel was read, and the epistle a step lower; they likewise published from this place the acts of martyrs, the commemoration of departed saints, &c. Here, too, converts made their confession of faith; and bishops their defence, when accused: treaties also were sometimes concluded, and the coronations of emperors and kings performed, in this place. A late writer shows, that the usual place from whence the ancients preached was the steps of the altar; and when St. Chrysostom and St. Augustine preached from the *ambo*, it was considered an extraordinary circumstance.

AMBOISE (George D'), a cardinal, was born of a noble French family in 1460. He became successively bishop of Montauban, archbishop of Narbonne, and lastly of Rouen. Louis XII. made him prime minister, and he soon acquired great and just popularity by taking off the taxes which had usually been levied on the people at the accession of every new monarch. The king, by his advice, undertook the conquest of the Milanese, and succeeded. Soon after this, he was appointed the pope's legate in France, with the dignity of cardinal, and in that capacity effected a considerable reform among the religious orders. He died in 1510; and on his death-bed often said to the friar who attended him, 'Brother John, why have not I been my whole life brother John?' D'Amboise was certainly one of the best statesmen France ever possessed. His nephew, George D'Amboise, succeeded him in the archbishopric; and in 1546 was created a cardinal. He died in 1550.

AMBOISE, a town of France, in the department of Indre and Loire, arrondissement of Tours, seated at the confluence of the rivers Loire and Massee; 15 miles east of Tours, and 141 south-west of Paris. The town is mean and ill built, consisting only of two streets, but with the suburbs containing about 5600 inhabitants. The principal places of note are the fine promenade, the two churches, and the castle. The manufactures are woollen and silk stuffs, buttons,

swords, and other hardware. The silk stuff called *amboisiennes* is peculiar to this town; and the steel from the establishment of Sanche approaches in hardness and durability very near to that of Sheffield. The castle is on a craggy rock, extremely difficult of access, and the sides of which are almost perpendicular. At its foot flows the Loire, which is divided into two streams by a small island. To this fortress the duke of Guise, when an insurrection among the Huguenots was expected, removed Francis II. for his security. Only two detached parts of the ancient castle now remain, one of which was constructed by Charles VIII. and the other by Francis I. The former of those princes was born at Amboise, and died here in 1498. Lon. 0°. 54' E. lat. 47°. 25' N.

AMBON, in anatomy, *ἀμβωνία*, the edge of the sockets in which bones are inserted.

AMBONG, a large and deep harbour on the north-west coast of Borneo, with an island in the centre. Lat. 6°. 14'. N. long. 116°. 25'. E.

AMBOON, or **AMBOOR**, a district of Hindostan, formerly included in the territories of the Nabob of Arcot, but ceded, with the rest of his possessions, to Great Britain in the year 1801. It is now included in the Arcot district of the Carnatic. In Amboon the thermometer in the hot season rises in the shade to 100 degrees, and in the sun to 120 degrees. It is surrounded with hills, whose skirts are covered with the date and palmyra trees, and which embosom well watered plantations of the cocoa nut, tobacco and mango. The river Palar enters them about three miles east of the town of Amboon, and is conducted by various works along the margin of the heights.

AMBOON, the capital of the above district, is situated on the river Palar, thirty miles west of Arcot in N. lat. 12°. 51', and E. lon. 78°. 50'. It stands at the foot of a high hill, which was once defended by a considerable fort now in ruins; and is a compact and well-built town. The lower part of the fortress is used as a provincial prison. It stands completely isolated from the place, on a mountain which has a broad plain on the summit, containing two invaluable tanks of water. The atmosphere on this summit is delightfully cool and refreshing. It has been principally an object of British policy to dismantle this fort; few places in India have more natural facilities for defence, or have been more prized in former times as rallying points in war. The principal export of Amboon is a superior castor oil.

AMBOTON, one of the Philippines near the south coast of Mindanao. Lon. 121°. 8'. E. lat. 12°. 15'. N.

AMBOULE, a province and town of Madagascar, somewhat to the northward of south lat. 23°., is said to be a fertile and agreeable country, watered by the river Manampani, whose mouth lies in south lat. 23°. 30'. This country produces plants and fruits in great plenty, and iron mines are also found here; the cattle also are extremely fat, and their flesh excellent. Near the town is a fountain of hot water, within twenty feet of a river whose sand is almost burning. The people are employed in manufacturing the iron

and steel, which they have from their own mines, into different instruments, which they do with tolerable skill. Their governor is honoured with the title of rabertau, or great lord.

AMBOY, a city of New Jersey, Middlesex county, situated at the head of Rariton bay, and standing on a neck of land between Rariton river and Arthur Kull sound. It lies open to Sandy-Hook, and has one of the best harbours on the continent, which may be entered in almost any weather. It is a port of entry and post-town, but not in a flourishing state. It is thirty-five miles south-west of New York, and seventy-four north-east of Philadelphia. Long. 74°. 50'. W. lat. 40°. 35'. N.

AMBOYNA, the largest and most valuable of the Molucca Islands in the Indian Ocean, and the seat of their government. It lies in E. long. 128°. 15', and S. lat. 3°. 42', and is between fifty and sixty English miles in length from north to south. On the western side it is divided by a bay into two peninsulas, one of which is called Hitou, being twelve leagues long and two and a half broad; and the other Leytimor, about five leagues in length and one and a half in breadth. There is an inferior harbour on the eastern side, where the Portuguese originally erected their principal fort. It has no river of importance, but its general aspect is beautiful, and the climate is generally salubrious. The rainy season sets in with the southerly monsoon, accompanied with thunder, lightnings, and earthquakes. The soil is a darkish red clay, mixed with sand. Some of the hills are incrusted with a copious efflorescence of sulphur, and one on the Hitou peninsula is called Wawani, or Brimstone-hill, from the great abundance of that article imbedded there. The deer and wild boar are the principal animals of the island; but there are a few sheep and black cattle, buffaloes, horses, and goats. The cassowary parades the mountains; but the chief boast of Amboyna is its rich productions of the vegetable kingdom. An astonishing variety of beautiful wood for inlaying, and other ornamental purposes, forms part of the commerce of the island; 400 different species are reckoned by Rumphius. The caput tree affords a valuable oil, and the sassafras an aromatic bark. The clove tree is, however, its staple production. In favourable situations this tree, according to some writers, grows frequently to the height of fifty feet; its branches spread wide from the stem; the cloves grow in clusters, but on separate stalks, and the leaves are long and tapering. It will bear from about nine or ten years, to one hundred years of age. The average quantity of cloves annually produced is from seven to twelve pounds per tree, but some have been known to afford thirty pounds; and the island, taken together, about 650,000 pounds. They are gathered from October to February. The Dutch, during this long period of their former possession of this island, attempted the entire monopoly of this spice; the number of trees was regularly registered by the governor, all the plantations visited, and particular districts appropriated to their cultivation. They bought from the neighbouring islands all the cloves that other nations were likely to import, and in some

cases compelled their chieftains to destroy the rest, and the trees that bore them. The Dutch East India company's warehouse was the depository of the crop; and they are said to have prohibited the culture of many edible roots on the island, to deprive settlers and conquerors of the means of subsistence. When the cloves were gathered from the tree, they were dried before the fire upon hurdles, and sprinkled with water; by which means their natural colour, which is red, was changed into deep purple or black. The design of this process was said to be, to prevent the worm from getting into the fruit; but another motive was suspected,—that of adding to their weight.

Thirty years back, the Dutch allowed some nutmegs to be grown here, because Banda did not furnish a sufficient supply for the demand. Sugar and coffee are plentiful at Amboyna; the sago tree is a principal article of subsistence; and the few fruits cultivated are delicious; among the latter may be reckoned the mangusteen of Hindostan. They import their cattle and grain from the island of Java, and a variety of curious woods from Ceram.

Amboyna is inhabited by four distinct races of people; the Aborigines, the Amboynese properly so called, Chinese, and Europeans. The first, who are called Alforese or Horaforas, and seem to be of the same description as the Idaan or Maroot of other eastern islands, are now much reduced. They are represented as wild and savage, of a lighter complexion, and greater muscular power than the Amboynese; and their women handsome. The natives, like the other Malays, are rude and savage in their manners, and, when intoxicated with opium, are equal to the perpetration of any crime. Mixed races from intermarriages are nearly as fair as Europeans. Those who are the offspring of European fathers and native mothers are called mixtices or mestees; those of a mixtice and European marriage, poestices; and those of a European and poestice, castices. These children are all legitimated, and included with the European society of the island. The Chinese are industrious, and live much together. Some of the aboriginal race in the woods are said to be extremely barbarous, and to offer human sacrifices. Their dress consists of a loose shirt or frock of cotton cloth. The men wear large whiskers and mustachios; the women bind their hair in knots. Wives are bought of their fathers; and should they bear no children the contract is dissolved. When the English took this island in 1796 it contained about 45,252 inhabitants, of whom no less than 17,813 were protestants; and the rest Mahomedans and Chinese. The houses of the natives are made of bamboo canes and sago trees; they sleep upon mats; and use, as weapons, bows, darts, scimitars, targets, &c. Their chiefs are called rajahs. The Amboynese are said to be indolent, effeminate, and pusillanimous; and their women particularly licentious.

The Dutch governor of Amboyna had ten adjacent islands under his jurisdiction: Ceram, Ceram-Lavut, Bouro, Amblau, Manipa, Kelang, Bonva, Orna, Hionimoa, and Noussa-Laout; the three last isles are called Uliassers. The growing

of cloves is limited to the Uliassers and Amboyna.

Diegro D'Abrew and Ferdinand Magellan, two Portuguese adventurers, first discovered Amboyna in 1515; in 1564 it was taken possession of by Portugal, and afterwards conquered by the Dutch republic in 1605. The English had erected several factories in the country, which were protected by the Dutch fort; but disputes arising between the settlers, the treaty of 1619 between Great Britain and the United Provinces stipulated that the English colonists should reside unmolested at Amboyna, and possess one-third part of its cloves. In 1622 fresh differences arose, which were referred to the Dutch council at Jacatra, in the island of Java; and finally to the government of the two countries in Europe for decision. The Dutch colonists however contrived, by alleging a fictitious plot against the English, to make themselves masters of the whole island. This event is known in history by the name of the 'Massacre of Amboyna.' A plot, it was said by the Dutch authorities, was confessed by two soldiers in their service, and confirmed by an English prisoner, but these had been all first sentenced to the rack. Upon this evidence the English were accused of being confederates in a conspiracy against the Dutch possessions, ~~they~~ were immediately seized, loaded with irons, and thrown into prison. The most savage modes of torture were then resorted to by the Dutch governor, for the purpose of extorting a further confession from the unhappy sufferers: some were put to the rack, others half-drowned and miserably scorched with fire. Those who escaped this inhuman treatment were all executed, although they persisted in their innocence to the latest breath. The number of persons who thus perished were ten Englishmen, eleven Japanese, and one Portuguese. The day after these wretched men were put to death, the governor ordered public festivals and solemn thanksgivings for their deliverance from this pretended conspiracy. It is absurd to suppose that such a plot as pretended by the Dutch ever existed; for the number of the English did not exceed twenty persons upon the island, whereas the Dutch garrison in the fort amounted to three hundred men; and the English had not a single ship in the port, whereas eight Dutch vessels were lying off the town of Amboyna. In consequence of this massacre the English factory was withdrawn from the island, and the Dutch retained possession of the effects of the English merchants to the amount of £400,000. The English factories in the adjacent islands were also seized, and the traders forcibly dispossessed. James I. and Charles I. of England were either unwilling or unable to avenge the national honour upon the cruelty and cowardice of the Dutch; but Cromwell compelled the United Provinces, in his celebrated treaty with that power, to pay the sum of £300,000, as a small recompense for their atrocious conduct. From this time down to the year 1796, Amboyna remained quietly in the hands of its Dutch masters; but in that year the English admiral Rainier took it without opposition. It was restored to the Batavian republic at the peace of Amiens; and again taken by the

English in the year 1810. At the general peace of Paris, in the year 1814, the Dutch were again reinstated in the possession of it, under whose government the island is far from being in a flourishing condition.

AMBOYNA, the capital of the island, is situated on the peninsula of Leytimor, and commands a capacious harbour. It is a regularly built town, though most of the houses are of wood, and but one story high. Matted cane is neatly contrived to form a substitute for glass in their windows, and the roofs are made of the branches and entwined leaves of palm-trees. Abundance of water runs through this town in rivulets. There is an hospital; a good town-house; and two churches, in one of which divine service is performed in the Malay language. An earthquake completely destroyed one of the churches in 1755, and rent the other throughout; but they were immediately rebuilt. Between the fortifications of the harbour and the town is a fine esplanade, terminated by a handsome range of houses, shaded by a double row of nutmeg-trees, where many of the principal inhabitants reside.

AMBRACIA, one of the most considerable cities of ancient Epirus, situated on the river Arachthus, at a small distance from the sea; built, according to Polybius, by Ambrax son of Thesprotus, when the territory of his father had been ravaged by the Dryopes; and thus the origin of the Ambraciens is traced to an era about fifty years before the last war of Troy. At first it was a free city; but was afterwards reduced by the Aetaciæ, kings of Epirus, who chose it for the place of their residence. In process of time the Aetolians made themselves masters of it, and held it till the year before Christ 189, when it fell into the hands of the Romans. At this time Ambracia was a place of great strength. It was defended on one side by the river Arachthus, on the other by steep and craggy hills; and surrounded with a high and thick wall, above three miles in circumference. The Roman consul Fulvius began the siege by throwing up lines of circumvallation and contravallation; and building a wooden tower, in form of a castle, over against the citadel. The Aetolians, however, before the lines were quite finished, found means to throw about 1000 men into the place, and sustained attack in five different places at once. While Fulvius was carrying on the siege, Nicander, the Aetolian prator, brought 500 men into the city, under the command of Nicodamus, with whom Nicander agreed to attack the Roman camp in the night time: but Nicodamus did not appear. However, the garrison marched out, armed with fire-brands and torches; and though two parties were driven back, the third made a great slaughter of the Romans, and retired in good order into the city. The consul beginning to undermine the wall, they countermined him, and the two parties met, when a battle ensued; after which the Aetolians, in order to drive the enemy out, invented a machine, which is thus described: it was a hollow vessel with an iron bottom, bored through in many places, and armed with spikes at proper distances, to prevent the enemy from approaching; having filled it with feathers, they set it on

fire. and driving the smoke with bellows on the besiegers, and thus obliged them to leave the mine, half suffocated. At last Fulvius obtained the place by employing Amynander, king of the Athamanes, to persuade the inhabitants to surrender. From this time the city of Ambracia made no figure in history. It is scarce known where it stood; but Arba, in Upper Albania, seems best to agree with what is said of its ancient situation.

AMBRARIA, in botany, the *anthospermum Ethiopicum* of Linnæus.

AMBRESBURY. See AMESBURY.

AMBRIERE, or AMBRIERES, a town of France, the head of a canton in the department and arrondissement of Mayenne. It had formerly the title of barony, and contains 240 houses, 2230 inhabitants; three leagues north of Mayenne. Long. 0°. 33'. W. lat. 48°. 24'. N.

AMBRIZ, a river of Congo, forming a bay, and affording anchorage to small vessels, which enter from the south

AMBRONES, a people of ancient Gaul, who lived near the foot of the Alps, between Switzerland and Provence. They invaded the Roman territories, in conjunction with the Cimbri and Teutones; but were defeated with great slaughter by Marius about A.D.C. 102. Their women, who had staid during the engagement in a kind of fortification made with carts, on seeing their husbands flying, and the Romans in pursuit, armed themselves with axes, and fell with indiscriminating fury both on the pursuers and the pursued. Their first rage being spent, they offered to surrender, upon condition that their honour should be preserved; but this equitable request being denied, they first killed their children, and then themselves.

AMBROSE (Isaac), a presbyterian minister, ejected from Garstang in Lancashire in 1662. He wrote the *Prima, Media, et Ultima;* or the First, Middle, and Last Things; War with the Devils; Looking unto Jesus, &c. the last of which is to this day a popular tract.

AMBROSE (St.), bishop of Milan, one of the most eminent fathers of the fourth century, born in Gaul A.D. 333, according to Dr. Cave, or according to Dupin in 340. His father was at this time praefectus praetorio in Gaul; and resided at Arles, the capital of Gallia Narbonensis. A swarm of bees is said to have settled upon the mouth of the saint as he lay in the cradle; and was regarded as a presage of his eloquence. He soon acquired a considerable share of secular learning; and pleaded before Probus with so much success, that he was appointed his assessor, and soon after governor of the provinces of Liguria and Emilia. He settled at Milan; where, in 374, upon the death of Auxentius bishop of that city, there being a great contest between the Catholics and Arians concerning the choice of a new bishop, Ambrose thought it his duty, as governor, to go to the church to compose the tumult. At the close of his address to the people, a child exclaimed, 'Ambrose is bishop!' The voice of the infant was regarded by the multitude as a divine intimation to elect the orator to that office, which was accordingly done. Ambrose expressed considerable reluctance to

VOL. I.

accept the office, and adopted expedients to induce a change, which seem singular enough; such as acting with unwonted harshness and severity in his magisterial capacity, and receiving into his house women of bad character. He was, however, ordained bishop towards the latter end of 374, or beginning of 375. About the year 377, the barbarous nations making an incursion into the Roman empire, he fled to Illyricum, and afterwards to Rome. In 384 he was sent to the tyrant Maximus, who had usurped the empire, and prevailed upon him not to pass over into Italy. The heathens being encouraged by these intestine commotions in the empire, attempted to restore paganism, and employed Q. Aurelius Symmachus, prefect of Rome, a man of great eloquence, to plead their cause. This gave rise to the famous contest between St. Ambrose and him, about repairing the altar of victory. But Symmachus, having lost his cause, was expelled the city, and commanded not to approach within 100 miles of it. The petition which Symmachus presented to the emperor Valentinian II. is still extant. St. Ambrose wrote a confutation of it. In his office he met with much opposition from the Arians. Justina, the empress and mother of Valentinian, resolving to restore Arianism at Milan, demanded of him one of the churches, called the Portian church, but he refused it; and the people surrounding the palace in a body, she was obliged to desire him to pacify them. After this, Ambrose was a second time sent to Maximus on the behalf of Valentinian, who soon after retired to Thessalonica in Illyricum to desire Theodosius' assistance. Theodosius having defeated Maximus, and restored Valentinian, committed great cruelties at Thessalonica, and Ambrose exhorted him to repentance in a pastoral letter. Soon after this, the emperor coming to Milan, went to receive the sacrament at the great church; but Ambrose meeting him at the door, denied him entrance, and represented his guilt in the most forcible and pathetic terms. The emperor was struck with his words, and with great uneasiness of mind returned to his palace; but about a year after, Ambrose, being convinced of the sincerity of his repentance, admitted him into the church. In 392, Valentinian being assassinated, Ambrose was obliged to leave Milan; but he returned the year following, and died there the 4th of April, 397. The most considerable of his works is the *De Officiis;* but his writings are intermixed with many strange and peculiar opinions. Paulinus wrote his life, and dedicated it to St. Augustine; this life is generally prefixed to St. Ambrose's works; the best edition of which is that published by the Benedictines, two volumes folio, Paris, 1682 and 1690.

AMRROSE (St.), an island in the South Pacific, on the coast of Chili, five leagues due west from St. Felix island. It appears at a distance like two small islands; but they are joined by a reef. It lies in latitude 26°. 17'. 40". S. and long 79°. 8'. 35". W.

AMBRO'SIA, n. Αμβροσία, from α not, and Βροτος, mortal. The food of the gods; so called from its supposed power of be-

3 B

stowing everlasting life: applied to whatever is exquisitely grateful to the senses of taste and smell.

' Nectar et *ambrosium*, latices, epulasque deorum.
Ovid.

Thus while God spake, *ambrosial* fragrance fill'd
All heav'n, and in the blessed spirits elect
Sense of new joy ineffable diffus'd. Milton.

Through breaking ranks his furious course he bends,
And at the goddess his broad lance extends;
Through her bright veil the daring weapon drove
Th' *ambrosial* veil which all the graces wove:
Her snowy hand the razing steel profan'd,
And the transparent skin with crimson stain'd.

Pope's *Iliad*, v. 415.

AMBROSIA, in ancient mythology, from a privative, and $\beta\nu\tau\sigma\eta\varrho\eta$, mortal, denotes the food of the gods. It had the appellation ambrosia, as being supposed to render those immortal who fed on it; and it is said, that Berenice, the wife of Ptolemy Soter, was saved from death by eating it. Titonus was made immortal by Aurora, by eating ambrosia; and in like manner, Tantalus and Pelops, who, on account of their impiety, had been driven from heaven, and compelled to die upon earth, had their lives preserved. It had the power of healing wounds, and therefore Apollo, in Homer's *Iliad*, saves Sarpedon's body from putrefaction by rubbing it with ambrosia; and thus also Venus heals the wounds of her son, in Virgil's *Aeneid*. Lucian, ridiculing the follies of the heathen worship, says, that ambrosia and nectar, of which one is the meat, and the other the drink of the gods, were not so excellent as the poet describes them, since these deities would leave them for the blood and fat of the sacrifices.

AMBROSIA, in antiquity, a feast celebrated by the Aconians, in honour of Bacchus. They were also denominated Chœa and Lenœa, being held in the month called Lenœon.

AMBROSIA, in botany, a genus of the pentandria order, belonging to the monœcia class of plants; and, in the natural method, ranking under the 49th order, compositæ nucamentaceæ. Characters: male flowers compound; CAL. single-leaved perianth, the length of the florets: COR. uniform, tubular, flat, and hemispherical; monopetalous, funnel-shaped, and quinquefid: STAM. five very small filaments: ANTH. erect, parallel, and pointed: PIST. has a filiform stylus, the length of the stamina: STIGMA orbicular and membranous: the receptaculum naked.—Female flowers below the male ones, on the same plant, doubled: CAL. single-leaved perianthum, entire (with the belly quinquefidated,) one flowered, and persistent: COR. none: PIST. an ovate germen in the bottom of the calyx: STYL. filiform, the length of the calyx; the stigmata two, long, bristly: PERICARP. an ovate unilocular nut: seed single and roundish. Of this genus, five species are enumerated: 1. A. trifida, trifid-leaved ambrosia. 2. A. elatior tall ambrosia. 3. A. artemisiifolia, mugwort leaved ambrosia. 4. A. maritima, sea ambrosia. 5. A. arborescens, tree ambrosia. They are perennial, and may be propagated, either by cuttings or by seeds.

AMBROSIA, in medicine, a splendid title given by some physicians to certain alexipharmac compositions. Nic. Abn. *Frambesia* has written a treatise on the preparation of ambrosia.

AMROSIA, in natural history, is applied, by ancient authors, to the food of the bees.

AMBROSIACA, in ornithology, a species of *hirundo*, or swallow, inhabiting Senegal, and smelling particularly strong of ambergris; of a greyish brown colour, bill blackish, legs brown. In length it is five inches and an half, bill half an inch, the plumage darkest on the head and quills, and the tail very forked.

AMBROSIAN OFFICE, or **RITE**, in church history, a particular formula of worship in the church of Milan, which takes its name from St. Ambrose, who instituted that office in the fourth century. Each church originally had its particular office; and when the Pope, in aftertimes, took upon him to impose the Roman office upon all the western churches, that of Milan sheltered itself under the name and authority of St. Ambrose; from which time the Ambrosian ritual has prevailed.

AMBROSIN, in middle-age writers, a coin struck by the lords or dukes of Milan, whereon was represented St. Ambrose on horseback, with a whip in his right hand.

AMBROSINI (Bartholomew), professor of physic, and director of the botanical garden at Bologna, where he died in 1657. He published, 1. *Panacea ex Herbis quæ à sanctis denominantur*, 1630. 8vo. 2. *Historia Capsicorum cum Iconibus*, 1630, 12mo. 3. *Theodorica Medicina*, 1632, 4to. His brother and successor, Hyacinth, published several valuable works on botany.

AMBROSINIA, in botany, a genus of the monandria order belonging to the monœcia class of plants; the characters of which are: CAL. single-leaved spathe, divided by a partition into two cells: COR. none: STAM. none: ANTH. numerous, with two roundish concave nectaries at their base: PIST. is in the interior cell: germen roundish; STYL. cylindrical, and shorter than the spathe; STIGM. obtuse: PERICARP. a capsule, roundish and unilocular. There is but one species, a native of Turkey.

AMBROSIUS, **AURELIUS**, or **AURELIANUS**, a famous general of the ancient Britons, of Roman extraction. He was educated at the court of Aldroen of Armorica; who, at the request of the Britons, sent him over with 10,000 men to assist them against the Saxons, whom Vortigern had invited into Britain. The success of Ambrosius induced the Britons to choose him for their king, and compelled Vortigern to give up all the western part of the kingdom to the Roman high-way, called Watling-street. On the death of Vortigern, Ambrosius became sole monarch of Britain; and assumed the imperial purple, after the manner of the Roman emperors. Geoffrey of Monmouth tells us, that Ambrosius built Stonehenge near Salisbury in Wiltshire. Coming to a monastery near Caercaradoc, now Salisbury, where 300 lords, massacred by Hengist, lay buried, and resolving to perpetuate the memory of this action, he ordered his workmen to prepare a large quantity of stones and other

materials. But having here consulted the famous Merlin, he was advised, it is said, to send over to Ireland for certain great stones, called chorea gigantum, the giants' dance, placed in a circle on a hill called Killair, and his sons after a battle with an Irish prince brought away the stones. Alexander Mecham celebrates this fable in his poem *De divina sapientia laudibus*. See STONEHENGE. After the Britons had defeated the Saxons, and obliged them to retire northward, Ambrosius convened the princes and great men at York, where he gave orders for repairing the churches destroyed by the Saxons, and restoring the exercise of religion to its former lustre; and tells us he was poisoned at Winchester by one Eopa a Saxon, hired for that purpose by Passentius one of the sons of Vortigern; but the generally received opinion is, that he was killed in a battle which he lost in the year 508, against Cerdic, one of the Saxon generals.

AMBRUM, or EMBRUN. See EMRUN.

AMBRY, in antiquity, the place where arms, plate, and every thing belonging to house-keeping of a great family were formerly kept. Hence, probably, the ambry at Westminster was so called; or perhaps from aumonery, a house adjoining to an abbey; in which the charities were laid up and distributed to the poor. The word is still used in Scotland.

AMBRYM, one of the new Hebrides in the South Sea. It is about 60 miles in circuit, and exhibits the appearance of a volcano in activity. Long. 168°. 80°. E. lat. 16°. 15'. S.

AMBUBAJE, in Roman antiquity, were immodest women, who came from Syria to Rome, where they lived by prostitution, and by playing on the flute: the word is derived from the Syriac abub, which signifies a flute; although others make it to come from am and baia, because these prostitutes often retired to Baia. According to Cruquius, these women used likewise to sell paint for ornamenting the face, &c.

AMBUBEIA, in botany, wild succory.

AMBULANT, or **AMBULATORY COMMISSIONERS**, were commissioners under the old government of France, who had no settled office; but visited all the offices within a certain district, to see that nothing was done in them against the king's right and the interest of his farms.

AMBULANT, in commerce, is applied to those brokers at Amsterdam, or exchange agents, who have not been sworn before the magistrates.

AMBULATION, n. { *Ambulatio*, Lat.
AMBULATORY, n. & adj. { Walking.

On fair ambulando horse they sit.

Gower. Con. A. b. iv.

A knight dormant, ambulant, combatant!

Gayton's Notes on Don Quixote.

From the occult and invisible motion of the muscles, in station, proceed more offensive lassitudes than from ambulation. *Brown's Vulg. Err.*

The gradient, or *ambulatory*, are such as require some basis, or bottom, to uphold them in their motions: such were those self-moving statues, which, unless violently detained, would of themselves run away. *Wilkin's Math. Magick.*

He was sent to conduct thither the princess, of whom his majesty had an *ambulatory* view in his travels. *Wotton.*

AMBULATION, in medicine, a term used by some for the spreading of a gangrene

AMBULATOR, in entomology, a species of lamia, figured by Petiver *Gazop.*, and described by Fabricius. The anterior part of the thorax is armed on each side with two spines, and the body clouded with cinereous and chestnut. It is properly a *cerambyx* of Linnaeus.

AMBULATORIA TURRIS, in ancient warfare, an engine or battery, on wheels, for taking towns.

AMBULATORIUS, in entomology, a species of ichneumon, very rare, with a yellowish scutellum, and spotted thorax, the second joint of the abdomen ferruginous brown, the margins of the others white. It inhabits Great Britain, and was first described by Fabricius in the *Species Insectorum*, from a specimen in the cabinet of Sir Joseph Banks, Bart.

AMBULIA, in botany, a genus of the didynamia angiospermia class and order. Essential characters: CAL. quindentated: COR. tubulose, quadridid, with unequal segments: CAPS. pentagonal, single-celled, and single-seeded. One species, viz. *A. monosperma*, of Gmelin, or *A. aromatica* of La Marek. This plant, according to La Marek, grows in Malabar, in a sandy and watery soil, and appears to be annual. All its parts have a sweet and aromatic smell, resembling pepper when green. Its taste is bitterish; and it is administered in a decoction for fevers, or in sour milk for vertigo.

AMBURBIALES VICTIMÆ, victims carried round the city of Rome, and afterwards sacrificed. See next article.

AMBURBIUM, or **AMBURVIUM**, in Roman antiquity, from ambire, to go round, and urbs, the city; a procession made by the Romans round the city and pomœrium, in which they led a victim, and afterwards sacrificed it, in order to avert some calamity that threatened the city. Scaliger in his notes on *Festus*, and several other critics, maintain the amburvia to have been the same with the **AMBARVALIA**, which see.

AMBURY, or **ANBURY**, among farriers, denotes a tumour, wart, or swelling, which is soft to the touch, and full of blood, sometimes cured by tying a horse-hair very hard about its root; and when it has fallen off, which happens in about eight days, strewing some powder of verdigris upon the part, to prevent the return of the complaint. If the tumour be so low that nothing can be tied about it, it is cut out with a knife, or burnt off with a sharp hot iron; in sinewy parts, they eat it away with oil of vitriol, or white sublimate. Many farriers recommend the following preparation: take three ounces of green vitriol and one ounce of white arsenic; beat them to a coarse powder, and put them into a crucible; place the crucible in the midst of a charcoal fire, stirring the substance, but carefully avoiding the poisonous steams; when the whole grows reddish, take the crucible out of the fire, and when cool, break it and take out the matter at the bottom; beat this to powder in a mortar, and add to four ounces of this powder five ounces of album rhosis; make the whole into an ointment, and let it be applied cold to warts; rubbing them with it every day.

AMBUSCADE, *n.* *Emboscudo*, Spanish; **AMBUSCA'DO,** from *bosque*, a bush. To **AMBUSCA'DOED,** ambush is to hide in a **AM'BUSH, v. & n.** bush in order to surprise an enemy.

AM'BUSHMENT. Applied literally and metaphorically to any mode of concealment adopted for the purpose of stratagem.—*Busse, enbusse, bussemant, and embussemant are common in R. Brunne.*

Saladyn priuely was bussed beside pe floun.

R. Brunne, p. 187.

In secret *ambush* I, in yonder wood, in place not wide,
That so both wayes I may besidge, myselfe intend to
hide.

Tycyn.

A winding vale there lay, within the shade,
Of woods, by nature for an *ambush* made.

Pitt.

Againe great dole on either partie grewe,
That him to death unfaithful Paris sent;
And also him that false Ulysses slew,

Drawne into danger through close *ambushment*.

Spenser. Virgil's Gnat.

Like as a wily fox, that having spied
Where on a sunny bank the lambs do play,

Ful closely creeping by the hinder side,
Lies in *ambushment* of his hoped prey.

Spenser. Nor shall we need,

With dangerous expedition, to invade
Heav'n, whose high walls fear no assault or siege,
Or *ambush* from the deep.

Milton's Paradise Lost.

Thick as the shades, there issue swarming bands
Of *ambush'd* men, whom by their arms and dress,
To be Taxallan enemies I guess.

Dryden's Indian Emperor.

When I beheld a fashionablē table set out, I fancy
that gouts, fevers, and lethargies with innumerable
distempers, lie in *ambuscade* among the dishes.

Addison.

AMBUSTA, in entomology, a species of phalaena of the noctua family. The thorax is crested; and the wings are incumbent, greyish-brown, with three yellowish streaks, an annule in the middle, and an undulated streak behind. This moth is produced from a naked brown larva, with white lines. The antennae are ferruginous, white at the base; head and thorax reddish-grey. Posterior wings white, tips brown. Inhabits Austria, on Lichen parietinus. *Fabricius.*

AMBUSTA, in medicine, burns or scalds.

AMBUSTUS, in ornithology, a species of falco. The body is of a pale tawny colour, front of the head between the eyes and bill naked, cere large, legs bluish. This is the tawny vulture of Brown and Latham. The bill is dusky, short and thick, cere large, and beset with bristles, the chin bearded with a tuft of long slender feathers: head, neck, breast, belly, and thighs, pale tawny; coverts of the wings intermixed with brown; tail dirty white, with brown bands; legs slender, bluish claws, long and slightly bent. The length of this bird is two feet four inches; it inhabits Falkland islands.

AMCHITCHIE, one of the Fox Islands, in the North Pacific Ocean. Long. 178°. 14'. E. lat. 53°. 22'. N.

AMEA, in botany, a name given, by the natives of Guinea, to a plant which they use in bleedings at the nose, by drying and powdering the leaves, and snuffing up the powder. It seems to be a species of the plant called pajamirioba,

by Sir Hans Sloane, in his Jamaica Catalogue. Its leaves are large and alated, and of a beautiful green, even when dried.

AHMEDABAD.

AMEDANA, in botany, the *almis vulgaris* of Linnaeus.

AMEDEI, or **AMEDIANS**, in church history, a congregation of religious in Italy, instituted A. D. 1400, so called from their professing themselves amantes Deum, ‘lovers of God’; or rather amati Deo, ‘beloved of God.’ They wore a grey habit, wooden shoes, and girt themselves with a cord. They had twenty-eight convents, and were united by pope Pius V. partly with the Cistercian order, and partly with that of the Soceolanti, or wooden-shoe wearers.

AMEDNAGUR. See **AHMEDNUGGER**.

AMEIVA, in zoology, a species of Brazilian lizard, which, according to Maregrave, resembles the TABAGUIRA (which see) in figure, but has a bifid tail. Ray, however, doubts the existence of any such two-tailed species.

A'MEL, *n.* Ang. Sax. *mylcan* meltan, to

AME'LLED, *v.* melt. Supposed to signify enamelled.

And with a bend of gold tassiled
And knoppes fine of gold amiled.

Chaucer. Romant of the Rose.
Heaven's richest diamond set in amel white.

Fletch. Purple Id. x. 33.

A husband like an ammel would enrich

Your golden virtues. *Duchess of Suff.* act iv.

The materials of glass melted with calcined tin, compose an undiaphanous body. This white *amel* is the basis of all those fine concretes that goldsmiths and artificers employ in the curious art of enamelling.

Boyle on Colours.

AMEL CORN, from amyllum, Latin, starch; French rice, a species of grain from which starch is made.

AMELANCHIER, in botany, the chionanthus virginica and mespelus amelanchia of Linnaeus. *Raii Hist. Plant.*

AMELLI, in botany, kareta-amelpodi of Rheed, Malab. a plant, from the leaves of which the inhabitants of Malabar obtain a decoction good for the colic.

AMELIA POINT, the south point of the bay of islands on the west shore of King George's archipelago. Long. 224°. 25'. E. lat. 57°. 17'. N.

AMELIA, formerly **AMERIA**, or **EMILIA**, an episcopal city of Italy, in the pope's territories, seated on a mountain, between the Tiber and Nira, in a fertile country, 18 miles south-west of Spoleto, and 45 north of Rome. Lon. 12°. 20'. E. lat. 42°. 35'. N.

AMELIA, a county of Virginia, situated between Blue-ridge and the tide waters, having Cumberland county on the north, George county on the east, and Lunenburg county on the south and west. Amelia, including Nottaway, a new county, contains 18,097 inhabitants, of whom 11,037 are slaves.

AMELIA ISLE, an island on the coast of Florida, about seven leagues north of St. Augustine, and very near Talbot island on the south, at the mouth of St. John's river. It is thirteen miles long and two broad, is very fertile, and has an excellent harbour. Its north end lies opposite Cumberland Island, between which and Amelia

Isle is the entry into St. Mary's river, in lat. 30°. 52'. N. lon. 67. 23'. W.

AMELIORATE, v. } *Ameliorare*, modern
AMELIORATION. } Latin; Fr. *améliorer*; Lat. *meliōr*. To better, to mend, to improve.

The class of proprietors contributes to the annual produce by the expense which they may occasionally lay out upon the improvement of the land, upon the buildings, drains, enclosures, and other *ameliorations*, which they may either make or maintain upon it.

Smith's Wealth of Nations.

His humanity must exult at the probability of their lot being so much *ameliorated*.

Swinburne's Travels through Spain, letter 36.

AMELLUS, STARWORT, a genus of the polygamia, superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, compositae oppositifoliae. The characters are: common CAL. imbricated and roundish: compound COR. is radiated: the hermaphrodite corollas numerous in the disk; the female numerous in the ray; proper corolla of the hermaphrodites are tubular and quinquefid; of the females, tongued, loose, and two or three toothed: STEM. in the hermaphrodites, consist of five short capillary filaments: the antheræ cylindric and tubular: PIST. an ovate germen; a filiform stylus, the length of the stamina; and two filiform stigmata: there is no pericarpium, but the calyx unchanged: the seeds are ovate and solitary; the pappus is hairy, the receptaculum chaffy. Of this there are two species, viz. 1. A. lychnitis, with one flower on each footstalk. This is a native of the Cape of Good Hope, and is a perennial plant, rising about three feet high. 2. A. umbellatus, with flowers growing in umbels, a native of Jamaica, from two to three feet high.

AMELLUS, in Virgil, is used for the aster Atticus, and by some other botanical authors for the caltha palustris.

AMELOT DE LA HOUSSAI (Nicholas), born at Orleans in 1634, was much esteemed at the court of France, and appointed secretary of an embassy which that court sent to the commonwealth of Venice; but his writings afterwards gave such offence, that he was imprisoned in the Bastile. They were: 1. *Histoire du Gouvernement de Venise*, &c.; Paris, 1676. 2. *La Morale de Tacite*; 1686. 3. A Translation of Palafox's Theological and Moral Homilies upon the Passion of our Lord; besides Translations into French of Machiavel's Prince; Father Paul's History of the Council of Trent; Baltasar Gracian's Oraculo Manual; and the first six books of Tacitus's Annals. Niceron also gives a list of some other pieces.

AMELOTTE (Denis), was born at Saintonge, in 1606, and died in 1678, leaving, 1. *La Vie du P. D. Gondren*, 4to. Paris, 1643. 2. A French Translation of the New Testament, in 4 vols. 8vo. 1666-8. 3. *Abrégé de la Théologie*, 4to. Paris, 1675. 4. *Les Epîtres et les Evangiles de toute l'Année*; &c.

AMELOPODI, in botany, an Indian tree, used as an antidote against the bites of serpents. *Raii Hist. Plant.*

AMEN', interj. יְהִי, Heb. whence Gr. αὕτη, used in scripture, and still in the Christian

church at the conclusion of prayer. It signifies verily; so be it; or so it ought to be. It has been rendered literally into the languages of most countries, possessing a translation of the scriptures.

One cried, God bless us! and, *Amen!* the other, As they had seen me with those hangman's hands: List'n'ing their fear, I could not say *Amen*, When they did say God bless us.

Shakspeare's Macbeth.

Blessed be the Lord God of Israel, from everlasting and to everlasting, *Amen* and *Amen*.

Psalm xli. 13.

AMEN, among the Jews, was used likewise to affirm any thing, and was a sort of affirmation used often by our Saviour; Αμην, Αμην, λεγω τιμην, i.e. 'Verily, verily, I say unto you.' It is also understood as expressing a wish; as 'amen, so be it,' Num. v. 22. In this sense, the word has been adopted into almost all the modern languages, without any alteration. It was likewise used as an affirmative, 'amen, yes, I believe it,' 1 Cor. xiv. 16. The Hebrews began the five books of Psalms, according to their way of distributing them, with the words amen, amen; which the Septuagint have translated γένοτο, γένοτο; and the Latins, fiat, fiat. The Greek and Latin churches have preserved this word in their prayers, as well as hallelujah and bosannah; because they observed more energy in them, than in any terms which they could use in their own languages. At the conclusion of the public prayers, the people answered with a loud voice, amen; and St. Jerome says, that at Rome when the people answered amen, the sound of their voices was like a clap of thunder: 'In similitudinem cœlestis tonitri amen reboat.' The Jews assert, that the gates of heaven are open to him who answers amen with all his might!

AMENABLE, Fr. *ameur*, to bring or lead unto. Amenable may be that which may be brought; to answer enquiries, to account for actions.

Again, because the inferior sort were loose and poor, and not *amenable* to the law, he provided, by another act, that five of the best and eldest persons of every sept, should bring in all the idle persons of their surname, to be justified by the law.

Sir John Davies on Ireland.

The sovereign of this country is not *amenable* to any form of trial known to the laws.

Junius's Letters, ded.

AMENABLE, or **ANAINABLE**, in law, is applied to a woman who is supposed to be governable by her husband.

AMENAGE, v. } To menage or manage

AMENANCE. } See **MANAGE**.

With her, [Occasion,] whose will raging Furor tame,
Must first begin, and well her *amene*.

Spenser's Faerie Queene II, act iv. sc. 11.

For he is fit to use in all assays,
Whether for arms and warlike *amenance*,
Or else for wise and civil governance. *Spenser.*

AMENANUS, in geography, a river of Sicily, now Judicello, that had its source in Mount Etna, and a very small stream. *Ovid. Fast.* l. iv. v. 467.

Necnon Sicanias volvens Amenanus arenas
Nunc fluit; interdum suppressis fontibus aret.

AMEND'. v. Lat. *emendare*, *e* from and
AMENDS', *menda*, a fault, which Vossius thinks is from the Greek
AMEND'ER, n. *μετανοεῖν*; for it is properly
AMEND'FUL, *μετανοεῖν*; called *menda*, when any thing
 is deficient. To free from deficiency, fault, or
 blemish; to repair, correct, improve, reform.

Bute ys wills al clene was yond for to *amende*,
 And attur all pis to Wynchestre from Londone he
 wende,

For to *amande* þilke side and so and so to Salusbury
 And so for to *amende* more, to be downe of Ambres-
 bury.

R. Gloucester, p. 144.

Sir ert þou not feid of wreche of Gode's ire,
 þat þou wilt werre bigynne, without *amendment*,
 Aegyn God don synne aegyn holy kirke had went?
 Irede þow mak *amends* of þat grete misdede.

R. Brunne, p. 391.

And axide of hem the our in which he was *amend-
 did*, and their sciden to him, fro yistirday in the
 seven the our the fuere leste him.

Wyclif, John, iv.

Now hit thyn kep me in pouht pat evere ich so
 wroughte

Lord er ich lyf lete, for loue of py selvo
 Graunte me goode Lorde, grace of *amende*.

Vision of Pier's Ploughman, p. 92.

Povertie is hateful good ; and as I geese,
 A ful gret bringer out of bisene.
 A gret *amender* eke of sapientie.
 To him that taketh it in patience.

Chaucer. The Wife of Bath's Tale.

It is an assured sign of a worthy and generous
 spirit whom honour *amends*: for honour is, or should
 be the place of virtue, and as in nature things move
 violently to their place, and calmly in their place :
 virtue in ambition is violent, in authority settled and
 calm.

Lord Bacon's Essays.

ROL. Away with him, hence, hail him straight to
 execution.

AUB. Far fly such rigour your *amendful* hand.

ROL. He perishes with him that speaks for him.

Beau, and Fletch. Bloody Bro. act iii.

Our Lord and Saviour was of opinion, that they
 which would not be drawn to *amendment* of life, by
 the testimony which Moses and the prophets have
 given, concerning the miseries that follow sinners
 after death, were not likely to be persuaded by other
 means, although God from the dead should have
 raised them up preachers.

Hooker.

If I have too austerely punish'd you,
 Your compensation makes amends.

Shaksp.

Of the *amends* recovered, little or nothing returns
 to those that had suffered the wrong, but commonly
 all runs into the prince's coffers.

Raleigh's Essays.

There I, a pris'ner chain'd, scarce freely draw
 The air imprison'd also, close and damp,
 Unwholesome draught ; but here I feel *amends*,
 The breath of heav'n fresh blowing, pure and sweet,
 With day spring born ; here leave me to respire.

Milton.

Some little hopes I have yet remaining, that I may
 make the world some part *amends* for many ill plays,
 by an heroick poem.

Dryden.

If our souls be immortal, this makes abundant
amends and compensation for the frailties of life, and
 sufferings of this state.

Tillotson.

There are but few pleasures that make us *amends*
 for the pain of repeated disappointments.

Couper's Letters.

AMEND, or **AMENDE**, in the ci-devant French
 customs, was a pecuniary fine, imposed by a
 judge for any crime, false prosecution, or ground-
 less appeal.

AMENDE HONORABLE, was an infamous kind
 of punishment formerly inflicted in France, upon
 traitors, parricides, or sacrilegious persons. The
 offender being delivered into the hands of the
 hangman, his shirt was stripped off, a rope put
 about his neck, and a taper in his hand ; then he
 was led into court, where he was obliged to ask
 pardon of God, the king, the court, and his
 country. Sometimes the punishment ended here,
 but sometimes it was only a prelude to banish-
 ment to the galleys, imprisonment in the Bastile,
 death, or torture. Amende honorable is also a
 term used for making recantation in open court,
 or in presence of the person injured.

AMENDMENT, in law, may take place, unless the error lies in giving judgment, for in that case it is not amendable, but the party must bring a writ of error. A bill may be amended on the file at any time before the plea is pleaded ; but not afterwards, without motion and leave of the court.

AMENDMENT OF A BILL, in parliament, is some alteration made in the first draught of it.

AMENDMENT OF A MOTION, in public meetings, is to be proposed before the chairman puts the motion ; and if seconded, is put by him before the motion.

In cases of wrong returns, so reported by the committee of privileges and elections, and voted by the house of commons, it is usually ordered that the returns be amended by the returning officer, according to the directions of the house, without issuing a new writ.

Amendments ought always to be in that house from whence the thing to be amended originally proceeded, though the directions for the amendments came from the other house. Hakew. Mamm. of Passing Bills, p. 167.

AMENDOLARE, in geography, a town of Italy, in the kingdom of Naples, and province of Calabria Citra ; fourteen miles north-east of Cassano.

AMENDUS, in ancient geography, a town of Caria, supposed by Martiniere to be Myndus.

AMENEBURG, in geography, a town of Germany, in the circle of the Lower Rhine, five miles east-south-east of Marburg, and forty-eight north-north-east of Mentz.

AMENIA, a town of Asia Minor, belonging to the Chalybes, who inhabited the eastern part of Pontus.

AMENIA, in geography, a thriving township of Duchess County, New York, in America, six miles from Sharon in Connecticut ; containing 3078 inhabitants, of whom 383 are electors.

AMENITY, Lat. *amanus*, which Festus thinks so called, because it alludes to the *love* of itself, (*ad se amandum*). Pleasantness, sweetness, agreeableness.

If the situation of Babylon were such at first, as it was in the dayes of Herodotus ; it was rather a seat of *amenity* and pleasure then conducing unto this intention ; it being in a very great plain, and so an improper place to provide against a general deluge by towers and eminent structures.

Brown's Vulgar Errors.

AMENORRHOEA of *a*, priv. *μενος*, the menses, and *ρεγειν*, to flow ; in medicine, an absence or deficiency of the menstrual excretion in women. See **MENSES** and **CHLOROSIS**.

AMENTACEOUS, in botany, a term applied to the flowers of certain trees and plants, which are composed of a vast number of apices, or anthers, hanging down in form of a rope, such as the hazel, &c. See CATKIN.

AMENTACEÆ, in botany, one of the natural order of Linnaeus, comprehending those plants whose fruit is a catkin. Linn. Philos. Botan. &c. It is also the name of a class in the system of Tournefort and others, and hence is derived the adjective, amentaceous.

AMENTIA, in medicine, from *a priv.* and *mens*, the mind, a weakness of intellect, as either want of the memory, or incapability of receiving mental impressions. This lamentable malady is placed, by Dr. Cullen, under nervous diseases affecting the mind; because the mental deficiency is generally the most prominent symptom. In many instances, however, the bodily defects are equally conspicuous, and we may conclude that the cause of the disease is always to be traced to some imperfect organization of the body, particularly the brain and head. Amentia is divided into three kinds: when originating in birth, it is called *amentia congenita*; when from accident, as from the effects of fever, it is called *amentia acquisita*; and when from old age, *amentia senilis*.

AMENTUM, in antiquity, a thong tied about the middle of a javelin or dart, and fastened to the fore-finger, in order to recover the weapon as soon as it was discharged. The ancient Romans made great use of the amentum, thinking it helped to increase the force of the stroke; for which reason, some of their great men refused to use it, as confiding wholly in the natural strength of their own arms. It also denotes a latchet that bound their sandals.

AMEN'USE, *v. minuo, imminuo*, to lessen; Fr. *ameneuser*. To lessen, make little, diminish.

The thriddle [the spice of envy] is to *amenuse* the bountee of his neighbour.

Chaucer. The Personne's Tale, vol. ii. p. 223.

AMERAIDE, a kind of officer among the Saracens, answering to the governor of a province among the Europeans.

AMERBACH (John), a learned printer of Bazil, in Switzerland, in the fifteenth century. He first made use of the Roman type instead of the Gothic and Italic: he died in 1515. His son John was professor of law at Basle, scyndic of that city, and the intimate friend of Erasmus: he died in 1562, aged 67. There were other learned ministers of this family.

AMERCE, *v.* Lat. *merces*, a *merando*,

AMERCE'MENT, or *says Vossius, after Varro*:

AMERCIAMENT, *and merco*, whence *merendo*, from *μερος*, a part or share. To take a portion or share of money or goods; to impose a fine or penalty; to exact a recompence.

They ben clerkes her courts they overse,

Her poor tenurice fully they slite

The hier that a man *amerced* be

The gladiier they woll it write.

Chaucer's Ploughman's Tale, fol. 96.

They shall *amerce* him in an hundred shekels of silver, and give them unto the father of the damsel, because he hath brought up an evil name upon a virgin of Israel.

Deut. xxii. 19.

All *amergements* and fines that should be imposed upon them, shall come unto themselves.

Spenser's State of Ireland.

Where every one that misseth then her make Shall be by him *amerced* with penance due.

Spenser.

But I'll *amerce* you with so strong a fine, That you shall all repent the loss of mine.

Shakespeare.

Millions of spirits, for his fault *amerced* Of heav'n, and from eternal splendours flung For his revolt.

Milton.

AMERCEMENTS, in law, differs from a fine in being imposed arbitrarily in proportion to the fault; whereas a fine is a certain punishment settled expressly by some statute. Manwood, in his Forest Law, makes another difference, and says, amercement is a more easy and merciful penalty, and a fine more heavy and severe one. A court of record can impose a fine; other courts can only amerce. By Magna Charta a freeman cannot be amerced for a small fault, but in proportion to the offence, and that by a judgment of his peers. 9 Hen. III. c. 4.

Before this period amercements were often excessive, and they were imposed on a thousand different occasions, not only for real crimes, but for trivial or imaginary offences, and on the most frivolous pretences; of course they were the sources of infinite vexations to the subjects, as well as of great riches to the sovereigns of England. They fell heavy, not only on the common people, but upon the greatest prelates and most powerful barons of the kingdom. This gave occasion to the above-mentioned article of the great charter, and to the rules founded upon it, which enacted, that no man should have a larger amercement imposed upon him than his circumstances or personal estate would bear; saving to the landholder his contement or land, to the trader his merchandise, and to the countryman his wainage, or team and instruments of husbandry.

AMERICIAMENT ROYAL, a pecuniary punishment inflicted upon a sheriff, coroner or other officer of the king, by justices, for an abuse in his office.

AMERI, in botany, the *Indigofera tinctoria* of Linnaeus.

AMERIA, in ancient geography, a district of Armenia, mentioned by Strabo (tom. ii. p. 835.) as situate in the vicinity of Cabira, in which was a celebrated temple of the month Pharnacus.

AMERIA, now **AMELIA**, a town of Italy, south-west of Spoleto, founded, according to Cato, 954 years before the Persian war, or 1135 years before Christ. Augustus established a colony in it. The celebrated Roscius is said to have been a native of this city; and its territory was assigned by Augustus to the veteran soldiers.

A M E R I C A.

1. AMERICA is the largest of what are termed the four grand divisions of the globe, extending through the greater part of both hemispheres, from the latitude of $55^{\circ}, 30'$. south of the equator to 74° . north. It stretches more than 9000 miles in length, and in its widest part 3800 miles in breadth. The average breadth may be estimated at 1500 miles, and the whole area at 12,000,000 of square miles. It lies between 35° . and 168° . of long. west from Greenwich, dividing the Atlantic from the Pacific Ocean. Its form is very irregular. On the south it has a long narrow projection, terminating in Cape Horn. On the north, it spreads to its greatest width; and stretching generally to the north-west, approaches within forty miles of the eastern extremity of Asia. Its limits on the north have not been fully examined; but the investigations of captain Parry prove that it is bounded by an arm of the sea, at least as far as long. 113° . west, from Greenwich; and, it can scarcely be doubted, that this strait is continued to the Pacific Ocean, and forms a complete separation between the continent and the arctic regions connected with Greenland. Extending through every zone, and comprising every variety of climate and soil, which are requisite for any production of the earth; distinguished for the grandeur of its natural features, and the richness and variety of its vegetables, minerals, and gems, this continent may well be entitled the New World. It is not less interesting as the birth place of all modern republics—the grand theatre on which a new series of experiments, upon the political and moral institutions of men, has been commenced. The Caribbean Sea and the Gulf of Mexico divide the continent into two great portions—North and South America. They are connected by the narrow Isthmus of Darien, in lat. 8° . north.

2. HISTORY.—It has been believed by many, that America was not unknown to the ancients; and, from certain passages in the works of some of the writers of antiquity, as well as from coincidences in the languages and customs of some of the nations of the old and new continent, plausible reasons have been advanced in favour of this theory. Whatever knowledge, however, the inhabitants of Europe possessed of America, no traces of it existed at the period of the revival of letters; and, it was generally supposed, that the Canaries, or Fortunate Islands, formed the western boundary of their world. For the correction of this error, and the discovery of a new continent, mankind are indebted to the genius and enterprise of Christoval Colon, a native of Genoa, better known to us by the name of Christopher Columbus. From a long and close application to the study of geography, this great man had obtained a knowledge of the true figure of the earth, far beyond what was common to the age in which he lived. Another continent, he conceived, necessary to complete the balance of the terraqueous globe; but he erroneously con-

ceived it to be connected with that of India. This error arose from the construction of the maps of that period; which represented the oriental countries of Asia, as stretching vastly farther to the east, than actual observation has proved them to extend. Having fully satisfied himself with the theoretical truth of his system, his adventurous spirit made him eager to verify it by experiment. For this purpose, he applied to the senate of Genoa, developing his views, and representing the advantages which would accrue to the republic, from the possession of a new route to the great source of opulence. The Genoese, however, treated the idea as absurd and chimerical, and rejected the proposal with contempt. Although disappointed in this first attempt, Columbus was not discouraged. Through his brother, Bartholomew, he applied to Henry VII. of England; but, the cautious prudence of that monarch, deprived him of the honour of patronising a man, whose friendship would have immortalized him. The next attempt of Columbus, was at the Portuguese court; which had in that age, greatly distinguished itself by favouring the spirit of discovery along the African coast. Here he met with an additional mortification, from an attempt to anticipate him in the enterprise; which, however, proved abortive at an early period. As a last resource, he now presented his scheme to the court of Spain. After eight years of anxious solicitation and contemptuous neglect, he at last obtained a gleam of royal favour on his bold and original project.

3. The interest of queen Isabella procured him three small vessels, with which he set sail from the port of Palos, in Andalusia, on the 3d of August, 1492. He steered directly for the Canaries, whence, after having refitted, as well as he could, his crazy and ill-appointed flotilla, he again sailed, on the 6th of September, keeping a due western course over an unknown ocean. Several days passed without a sight of land, and the anxieties of the sailors, arising from this circumstance, were heightened by the variation of the compass, then first perceived. An open mutiny took place, which required all the courage and address of the great navigator, to quell it. They pursued their course; but when thirty days had elapsed, without any indication of an approach to land, both officers and men joined in a second revolt. Columbus was forced partially to give way to their remonstrances. He consented to return, if, after proceeding three days longer, nothing appeared to confirm his expectations. With these assurances, they again proceeded, and about midnight, on the 11th of October, Columbus, who was standing on the forecastle, discovered a light a-head.

4. Morning displayed the joyful sight of land; and the sailors were now as ardent, in their expressions of repentance and admiration, as they had before been insolent and ungovernable. The island of St. Salvador, one of the Bahamas, was

the first part of America trodden by the feet of Europeans. From the rude poverty of the inhabitants, Columbus soon perceived that he was still at a distance from the shores of India. The island of Cuba was next discovered, and although no gold was found, the natives pointed to the east, where, in an island, which they called Hayti, this metal was said to abound. Columbus proceeded in that direction, and discovered Hayti on the sixth of December. Here he found some specimens of gold; and, leaving some men to form a colony, he returned to Spain. On his arrival, he immediately proceeded to court, where he was received with admiration and respect. The glory and benefit which promised to result from the discovery, rendered the government eager to forward his design. A fleet of seventeen sail was prepared; and Columbus, who was now appointed viceroy of all the countries he should discover, departed on his second voyage, accompanied by many persons of rank and distinction. During the progress of this voyage, he discovered the islands of Dominica, Marigalante, Guadalupe, Montserrat, Antigua, Porto Rico, and Jamaica. The success of this great man did not fail to excite envy and intrigue against him at the court of Spain. An officer was sent to act as a spy over his actions: and Columbus soon found it necessary to return to Europe, for the purpose of defeating the machinations of his enemies. After great difficulty, he obtained leave to set out on a third expedition, in 1498. Sailing south from Spain, as far as the equator, he then directed his course to the west, and steered with the trade winds across the Atlantic. At the end of seventeen days, the island of Trinidad was discovered; and, on the first of August, he reached the mouth of the great river Orinoco. From the magnitude of this stream, he concluded that he had discovered the continent; and, the continuance of land to the west, confirmed the belief. He then coasted along westward, to Cape Vela, from which he crossed over to Hispaniola. The new glory, which Columbus had now acquired, excited fresh intrigues against him, which prevailed so far, that he was superseded in his government, and sent home in irons. He justified himself, however, to the court; and, in 1502, was allowed to depart on a fourth voyage, in the course of which, he discovered the harbour of Porto Bello, and a considerable part of the continent. He then returned to Europe, and died at Valladolid, in the year 1506, in the 59th year of his age.

5. The honour of having made known to mankind the existence of North America, and, indeed, the first discovery of the continent was acquired by the family of Cabots, residents of Bristol, in England. The fame which Columbus had gained by his discoveries, spread through Europe, and inspired many with a similar spirit of enterprise. As early as the year 1495, John Cabot, a Venetian, obtained from Henry VII. of England, a commission for himself, and his three sons, 'to navigate all parts of the ocean, for the purpose of discovering islands, countries, regions, or provinces, either of Gentiles, or Infidels, which have been hitherto unknown to all

Christian people; with power to set up his standard, and take possession of the same, as vassals of the crown of England.' Such were the terms of this grant, which rivalled the bulls of the papal see, in the extent of the power and authority it professed to confer. In pursuance of this commission, John Cabot sailed from England, in 1497, carrying with him his three sons. On the 24th of June, 1497, he discovered a large island, to which he gave the name of Prima Vista, or the First Seen, now called Newfoundland. A few days after, he discovered a smaller island, to which he gave the name of St. John's; and, continuing his course westwardly, he soon fell in with the continent, and sailed along the coast of Labrador, as far as the latitude of $67^{\circ} 30'$. north. But, not meeting with the expected north-west passage, he changed his course to the south, and sailed along the whole coast, as far as Florida, having made the first and most extended discoveries of the *main land* of the New World.

6. A spirit of discovery was now universally excited. In 1499, Amerigo Vespucci, a Florentine, a man of science and genius, sailed with a small squadron to the New World, but made very little addition to the former discoveries. He, however, published, on his return, the first description of the new countries that had appeared, and the injustice of mankind has given his name to the whole continent, an honour to which Columbus was so much more justly entitled. In the year 1500, the coast of Brazil was accidentally discovered by Alvarez de Cabral, a Portuguese admiral, in consequence of having been driven too far to the west, on a voyage round the Cape of Good Hope. The idea entertained originally by Columbus, that America was part of the continent of Asia, was generally received until 1513, when the Pacific Ocean being descried from the mountains of the Isthmus of Darien, this delusion was dissipated. In 1512, Ponce de Leon, a Spaniard, sailed from Porto Rico, northwardly, and discovered the continent in $30^{\circ} 8'$. north lat. He landed on Easter-day, whence, according to some, Florida derives its name; but, according to others, it was so called from the verdure and bloom, with which, at that season, the country was covered. For many years the name was applied to the whole of the continent.

In 1517, Hernandez Cordova sailed from Havannah, with three barks, and 110 men, on a voyage of discovery. Steering a westerly course, the first land he saw was Cape Catoche, the eastern point of the peninsula, now called Yucatan. The Spaniards were here astonished to meet with natives, clothed in cotton garments, and exhibiting other traces of civilization and wealth. They attempted to land, but were repulsed, with great loss; and Cordova himself died soon after his return to Cuba. In the following year, Velasquez, the governor of Cuba, excited by the accounts given of the country, dispatched a second armament, under the command of Juan de Grialva, consisting of four ships, and 200 Spanish soldiers. This expedition sailed on the fifth of April, 1518, and completed those discoveries which led to the sub-

gation of Mexico. They first touched at the island of Cozumel, and then at another, which they called the Island of Sacrifices, from its being the first place where they had observed human sacrifices. They terminated their voyage at St. Juan de Ullua, and returned in triumph to Cuba, having examined a considerable extent of the coast, and ascertained the existence of the rich and extensive empire of Montezuma. From them this country received the name of New Spain. The success of this expedition, and the reports of the wealth to be found in New Spain, induced Velasquez to send out another armament of ten ships, and 550 soldiers, under the command of Hernando Cortez; and with this small force, aided by treachery and cruelty, that celebrated adventurer commenced the war in which he completely subdued the empire of Mexico.

8. Several years now elapsed without any further progress being made in the discovery of North America. The French, who had not displayed the same spirit of enterprise as their neighbours, entered the lists in 1524. In that year Francis I. sent John Verrazani, a Florentine, to America, for the purpose of making discoveries. He traversed the coast from lat. 28° . to 50° . north; but in a second voyage, some time after, was unfortunately lost. In 1525, Stephen Gomez, the first Spaniard who came upon the North American coast, with a view to discovery, sailed from Groyn in Spain to Cuba and Florida, thence northward to Cape Razo, in lat. 46° . north, in search of a northern passage to the East Indies. In the spring of 1534, a fleet was fitted out at St. Maloes, in France, by direction of Francis I. with the design of attempting discoveries. The command of the fleet was given to James Cartier. He arrived at Newfoundland in May of this year. Thence he sailed northwardly, and on the day of the festival of St. Lawrence he found himself in the midst of a broad gulf, which he named the St. Lawrence. He gave the same name to the river which empties into it. In this voyage he sailed as far north as lat. 51° ., expecting in vain to find a passage to China. In the following year he sailed up the river St. Lawrence as far as the Falls. He called the country New France; built a fort, in which he spent the winter, and returned the following spring to France. On the 12th of May, 1539, Ferdinand de Soto, with 900 men, besides sailors, sailed from Cuba, having for his object the conquest of Florida. On the 30th of May he arrived at Spirito Santo, from whence he travelled in various directions, and, after exploring a vast extent of country, and even reaching, as it is supposed by some, the river Susquehannah, died on the bank of the Mississippi, aged forty-two years. Cartier, in the next year, made a third voyage to Canada, built a fort, and began a settlement in 1541 or 1542, which he called Charlebourg, four leagues above Port St. Croix. He soon afterwards broke up the settlement, and sailed for Newfoundland. In 1542 Francis La Roche was sent to Canada by the French king, with 200 men, women, and children, but returned with his colony the next spring. In 1550 a number of adventurers sailed

for Canada, but were not afterwards heard of. No other attempt appears to have been made to settle Canada during this century. In 1562, a French squadron under the command of John Rebalt, arrived on the coast of Florida, and discovered a river, which is supposed to be the St. Mary's. As he coasted northwards, he discovered several other rivers, one of which he called Port Royal.

9. The attempts to find out a north-east passage to India having failed, the English sent out, in 1576, Captain Frobisher, to find a north-west passage. The first land which he made was a cape, which he named Queen Elizabeth's Foreland. In coasting northerly, he discovered the straits which bear his name. The two following years he made a second and a third voyage, which produced no material discovery. In the same year, Sir Francis Drake, being on a cruise against the Spaniards in the Pacific ocean, landed on the continent of North America, northward of California, took possession of a harbour, and called the surrounding country New Albion. In 1583, Sir Humphrey Gilbert obtained a patent from Queen Elizabeth for lands not yet possessed by any christian prince, provided he would take possession within six years. In 1583, he sailed to Newfoundland, and took formal possession of the continent of North America, in the name of the crown of England. In pursuing his discoveries, he lost one of his ships on the shoals of Sable, and, on his return home, a storm overtook him, in which he was unfortunately lost. In 1584, a patent was granted by Elizabeth to Sir Walter Raleigh, by the authority of which, he sent out a colony the next year. They arrived on the coast, and anchored a few leagues west of the Roanoke. Here they landed, and took possession of the country on behalf of Queen Elizabeth, calling it, in honour of her, Virginia. In 1585, a colony was planted, but became so disheartened, that they returned to England in 1586, with Sir Francis Drake. Another attempt was made, in the year last mentioned, to establish a colony in Virginia, but with similar ill success.

10. A third attempt, made in 1587, also failed; the colonists perished miserably, having either died of famine or been massacred by the Indians. In 1585, an English expedition, under the command of Davis, discovered Davis's straits; and examined the adjoining coasts as far as 72° . north latitude in 1587. In 1602, Bartholomew Gosnold with thirty-two persons, made a voyage to North Virginia, as it was then called, and discovered and gave names to Cape Cod, Martha's Vineyard, and Elizabeth Islands. Attempts were made to form a settlement in the vicinity, but without success; and it is believed that, at the beginning of the seventeenth century, there was not one European family settled on all the vast extent of coast from Greenland to Florida. In 1603, Bartholomew Gilbert, in a voyage to South Virginia, in search of the colony which was left there in 1587, landed near Chesapeake bay, where, in a skirmish with the Indians he was unfortunately slain. In the same year, the king of France granted by patent to M. de Mons all the country from the fortieth to the

forty-sixth degree of north latitude, under the name of Acadia. In 1605, George's islands and Pentecost harbour were discovered by captain Weymouth, who soon afterwards entered a large river, now supposed to be the Kennebeck or Penobscot. In 1606, James I. divided Virginia into two colonies, the northern and southern, which were granted to different companies. The next year, M. de Champlain sailed up the St. Lawrence, and founded Quebec. In 1607, the first permanent settlement was effected in the present state of Virginia, at James-town, the first English town in America.

11. Henry Hudson, a native of England, but at the time in the service of the Dutch East India Company, discovered, in 1609, and sailed up the river which has since borne his name. Settlements were soon after made here by the Dutch. In 1614, captain Smith explored the coast of Massachusetts, and thence southerly; and on his return home to London drew a map of the country, which he called New England, a name which has superseded that of North Virginia. In 1616, William Baffin discovered the great northern bay which bears his name. In 1620,

the first permanent settlement was effected at Plymouth, in New England. In 1627, a colony of Swedes and Fins came over, and made the first settlement on the Delaware river. In the reign of Charles I. Lord Baltimore, a Roman Catholic, obtained a grant of land upon Chesapeake Bay, and soon after came with a number of Catholics, and settled Maryland. Connecticut and Rhode Island were next settled from Massachusetts. New Jersey was granted to the Duke of York, by Charles II. In 1669, the settlement of the Carolinas began. In 1682, William Penn, with a colony of Quakers, arrived in Pennsylvania. Louisiana was colonized by the French in the beginning of the next century, and in 1732, Georgia was settled by general Oglethorpe.

12. Following its great geographical features, we divide the present article on America, into two parts; i.e. NORTH AMERICA; and again subdivide them into chapters, suggested by the great physical peculiarities, and political divisions of these two important portions of the globe.

PART I.—NORTH AMERICA.

CHAP. I.

GENERAL PHYSICAL DESCRIPTION.

NORTH AMERICA is the largest of the two great divisions of the American Continent, extending from the isthmus of Darien, in latitude 8°.; to Barrow's straits, in latitude 71°. north; and from Davis's to Behring's straits. Its greatest length from north-east to south-west, is 3000 miles, and its greatest breadth from east to west, 3800 miles.

13. SEAS, BAYS, AND GULFS.—The waters which intersect the American Continent, may be considered in connection with the three great oceans around it, of which they are branches—the Atlantic, the Pacific, and the Arctic oceans. The Pacific ocean has few branches of much importance, extending into the Western Continent—Cook's inlet, Norfolk Sound, Queen Charlottes, and Nootka Sounds, and the Straits of St. Juan de Fuca, are the only considerable indentations in the coast until we reach the gulf of California. This gulf extends towards the north, between the peninsula of California, and the main, to the distance of 800 miles, varying from 20 to 120 miles in breadth. Its entrance is between Cape St. Lucas, and Cape Corrientes. It is full of islands, and shoals, and its navigation is difficult. The harbour of Acapulco is the principal port on the peninsula; and the gulfs of Tehuantepec and Panama, are the two principal points proposed for opening a communication between the oceans.—The gulf of Guayaquil is the principal indentation in the coast of South America, until we reach the gulf

or Archipelago of Chiloe. The gulf is studded with numerous islands, and bears a striking resemblance to the Grecian Archipelago, in the liveliness and enterprise of its inhabitants, as well as in its natural features.

14. The straits of Magellan present the first opening from the Pacific to the Atlantic Ocean, extending 340 miles in a winding course, between California, and Terra del Fuego. The western current, from the Atlantic, passes through these straits into the Pacific, with great rapidity, and the navigation is very difficult.

15. The Atlantic Ocean makes but few encroachments upon the eastern coast of South America; and some parts of it are even destitute of convenient harbours. The principal openings are those formed by the two great rivers, the Amazon, and the Paraguay. These vast expanses of fresh water resemble ordinary gulfs, or bays, in size, the former being fifty, and the latter 180 miles in breadth. The La Plata is not safe as a place of anchorage, on account of the force of its current, and the sand banks with which it abounds. The best harbours on the eastern coast of South America, are those of Pernambuco, Bahia, and Rio Janeiro, the last of which is remarkably defended from the agitations of the ocean by an extensive reef resembling an artificial mole, and is considered one of the finest ports in the world.

16. In proceeding northward, from the river Amazon, we soon reach the extensive sea which

separate the two portions of the continent. They are separated from the main ocean, by the chain of the West India islands, and the appearance of the whole at once suggests the idea that they have been formed by the gradual encroachments of the current from the east, produced or aided by the trade winds; and that the islands are the relics of an extensive tract of land which formerly united North and South America. The principal divisions of this branch of the Atlantic are the Caribbean sea on the south, and the gulf of Mexico on the north. The island of Cuba, and the other large islands, often called the greater Antilles, form the northern limit of the Caribbean sea: it is separated from the ocean by the smaller chain, or Caribbean islands, and extending 1400 miles in length, and washes the coast of Colombia and Guatimala. The bay of Honduras, and gulf of Darien are its principal large divisions, and the harbour of Porto Bello, Carthagena, and Laguira are its best ports.

17. The gulf of Mexico washes the coast of Mexico and the United States, separated from the ocean by the sandy peninsula of Florida. It extends about 1000 miles in length, and 700 or 800 in breadth. The passage to the ocean is rendered easy by a rapid current, termed the gulf stream, which continually flows through the straits or gulf of Florida. The entrance is, for the same reason, very difficult, and requires a circuitous and dangerous navigation through the shoals and keys of the Bahama isles.

18. The gulf stream is one of the most remarkable permanent currents on the globe. It appears to be formed by the accumulation of water which the trade winds throw into the Caribbean sea, from the wide Atlantic; or striking the shores of the Isthmus of Darien, they are turned northward into the gulf of Mexico, and thence pass out by the most unobstructed passage between Cuba and the Bahamas, and the peninsula of Florida. It issues from the gulf with a velocity of four or five miles an hour, and sweeps along the American coast nearly parallel to it, at the distance of thirty to fifty miles from Cape Hatteras. The coast then taking a more northerly direction, the line of the gulf stream recedes from it until it reaches the banks of Newfoundland. Here it is turned towards the east, and would appear sometimes to reach the north-eastern coast of Europe. Tropical productions are frequently thrown up on the coast of Scotland and Norway, which could only find their way by this current; and in one instance the mast of a vessel burned in the West Indies, was cast upon the shore of the Hebrides. The current appears to pass in an immense curve to the Azores, where it is also traced by the American productions it throws up, and seems then to pass on, and be lost in the great western current from which it originated. Humboldt estimates that two years are occupied in the whole circuit. The gulf stream is readily distinguished from the surrounding ocean, by its greater temperature, produced by the tropical sun in the gulf of Mexico, and which it retains to the banks of Newfoundland, even in the winter season. The colour of its water, and

the sea-weed with which it abounds, are also very obvious indications. The vapours which rise from it render the atmosphere above it, and the winds which blow from it peculiarly damp. From the difference of temperature between it and the surrounding ocean, it is the theatre of frequent gales and thunder-storms. It diminishes in velocity, and increases in width, as it proceeds; and both circumstances are affected by the state of the wind. It is found that the current which runs through the gulf of Mexico, and ultimately forms this stream, throws up sand on the coast of Mexico, which renders its harbours shallow, and the coast difficult of navigation. The beds of sand, filled with sea shells, which have been discovered at ten leagues from the present shore, indicate that in this way the land is encroaching upon the sea, and the basin of the gulf gradually contracting. No good port is found along the coast; and the harbours of Cuba are the nearest places of safe rendezvous for the armed ships of Spain. That of the Havannah is the best.

19. A large part of the coast of the United States is also low and alluvial, like that of Mexico, and presents a succession of sand banks, separated from the shore by a series of shallow passages and sounds, which afford great facilities for the coasting trade, but none for foreign commerce. The harbours of Charleston, and the Savannah river, are almost exclusively the seat of foreign trade, until we reach the fine openings of the Chesapeake and Delaware bays. The Chesapeake bay resembles an inland sea, in the extent of its surface, the number of its tributary streams, and the character of its navigation. Its length is 180 miles, and its average breadth from ten to twenty miles. It receives several large rivers, and numberless small streams; and is the medium of extensive trade in itself.

20. Delaware bay is much less extensive, and must rather be considered as the prolonged estuary of the river of the same name. Its length is about sixty miles, and its breadth increases from three to thirty miles, in going towards the entrance. It is navigable for large vessels, but obstructed by shoals. At New York we enter on the primitive region of the United States, and find a corresponding change in the coast. The shores become bold, and indented with many harbours of great depth. The port of New York is one of the finest in the world, and the principal seat of foreign trade in the United States.

21. The larger branches of the ocean on the New England coast, are Long-island sound, about fourteen miles long, and three to twenty-five wide, dividing Long-island from the state of Connecticut. Narragansett bay, which penetrates the small state of Rhode island, and gives it every part of a coast. Buzzards bay, on the south side of the peninsula of Barnstable, and Massachusetts bay, in which is the harbour of Boston, on the north side, bounded by cape Cod and cape Ann.

22. The bay of Fundy divides the state of Maine from the British province of Nova Scotia. It is remarkable for the height of its tides, which sometimes flow from forty to sixty feet, with a rapidity which is scarcely credible, and which

sometimes renders them destructive to the cattle feeding on the shores.

23. The river St. Lawrence forms an extensive gulf at its mouth, which bears the same name. It is divided from the ocean by the islands of Newfoundland and Cape Breton, stretching about 400 miles from east to west, and an equal distance from north to south.

24. The seas and bays of the northern extremity of America must be considered as branches of the Arctic ocean, although the limits of this ocean are not yet ascertained.—Davis's straits is a passage 450 miles wide, by which we approach the division of the waters of the globe from the Atlantic ocean. In pursuing a direct course, we enter Baffin's bay, whose existence was for some time doubted; but which has been fully examined and surveyed in the recent voyages undertaken by order of the British government. It stretches between the coast of Greenland and Labrador, as far as lat. 80°. north. Its outlets or connections on the north have not been traced; nor is it known that there is any direct communication to the Atlantic on the east, except by the strait which insulates the point on which cape Farewell is situated.

25. At the entrance of Davis's straits are the straits of Hudson and Cumberland, leading into Hudson's bay, a large inland sea, extending from lat. 51°. to 68°. north, and from lon. 75°. to 95°. west. Its navigation is difficult, on account of the ice, which completely closes it during a large part of the year; and renders it dangerous during the period of its formation and destruction. It exceeds the Baltic in size. It does not abound in fish; but two species of the whale are taken here.

26. North of Hudson's straits, a strait was discovered by the British expedition under capt. Ross, and penetrated by captain Parry to Melville island, in the lon. of 113°. west, to which the name of Barrow's straits has been given. The land on the northern side was called North Georgia, but it was not ascertained whether it consisted merely of a group of islands, or formed a part of an extended tract of land. The difficulties and dangers attending the exploring tour, from the long winter period of darkness, and the short summer of light, with the consequent accumulation of ice, prevented captain Parry from ascertaining the connections of the southern land; and from determining whether any communication existed with Hudson's bay. An expedition sent into this bay during the following season was equally unsuccessful; but captain Parry approached so near to the situation in which the sea was seen by Hearn and Franklin, as to leave little doubt that there is a continued passage along the northern coast of North America, to the mouth of Mackenzie's river, and thence to the straits of Behring.

27. Another expedition has been sent to attempt farther discoveries; and a land party, under captain Franklin, with a second squadron sent by Behring's straits, will attempt to prosecute the same object in their mode, with the hope of forming a junction, or approaching so near to each other, that the geography of these unknown regions may be in some measure

settled, even if no practical result should follow. It is, indeed, quite improbable that a channel which could not be passed in two years of labour and suffering, by the best appointed ships, entirely appropriated to the conveyance of the men, fuel, and provisions, necessary for navigating in these cold and desolate regions, should ever become a regular channel of lucrative commerce, while the passage round cape Horn can be made with far more ease and safety in a shorter period.

28. MOUNTAINS.—North America is unrivalled for the magnitude of its lakes, and yields only to South America in the size of its rivers and basins. Its mountains are generally inferior in height to those of the other quarters of the world, but in the length of its chains it surpasses the eastern continent. It is traversed by two great chains of primitive mountains; the Rocky, or Chippewan mountains on the west, and the Appalachian chain, embracing the Allegany ridge, and the White mountains on the east.

29. The great western chain of North America may be considered as a prolongation of the Andes. Its origin may be traced to the Isthmus of Darien, where it is connected with the Andes by a low, but uninterrupted ridge. It increases in height as it advances north, pursuing an irregular course, sometimes in the centre, and sometimes on one side of the peninsula, until it reaches the eighteenth degree of latitude, where it stretches from south to north, and approaches the eastern coast.

30. In the Mexican division, there is a group of mountains which rivals the most elevated of the new continent; the principal are Popocatapetl, and the Pic de Oruciba, above 17,000 feet in height; and Irtaccihuatl, 15,000 feet high; all of them volcanic summits, unlike the South American Andes. The ridge of the chain here spreads into one extensive table land; and the most elevated summits, instead of forming a continued crest of peaks, are either dispersed upon this extended mountain top, or ranged in lines, which preserve no regular course. As far as the nineteenth degree of latitude, this chain is termed the Cordillera of Anahuac, or Mexico. Here it takes the name of the Sierra Madre, and runs north-west to Guanaxuato, where it sends off a branch to the east and another to the west. The principal chain extends northward to the sources of the Rio del Norte and Rio Gila, and on entering the United States receives the name of the Rocky, or Chippewan mountains. Only four of the summits in the southern part of the chain are covered with perpetual snow. The general aspect of that part is volcanic; and the country is subject to earthquakes and fiery eruptions, although they are less frequent than in South America.

31. In its middle course, between the latitudes of 35°. or 40°. and 55°. north, the great western chain has been called by various names; among which the most common are the Rocky, Shining, and Chippewan mountains; the last being derived from the Indian, and the only one which seems applicable as a distinctive title. This part of the range was quite unexplored, until it was traversed by Lewes and Clark, and more recently

by Major Long, under the direction of the government of the United States. To the latter we are particularly indebted for the most detailed and interesting accounts of these mountains, and the adjoining regions, which has yet been given. The general course of the Chippewan range is north-north-east. Its breadth varies from 50 to 100 and 200 miles. They rise abruptly from the elevated plains at their eastern base, towering into peaks of great height, which renders them visible at the distance of more than 100 miles on the east, and in some states of the air 140 miles. At this distance the view is that of several conic summits, unconnected at their base. At a nearer approach an uninterrupted chain is discovered, crowned with sharp conical peaks. The body of the range consists of ridges and peaks variously disposed, and interspersed with many broad and fertile valleys. The more elevated parts are covered with perpetual snows, which contribute to give them a luminous, and at a great distance even a brilliant appearance, from which they have derived their name of the Shining Mountains. They are chiefly primitive in their geological character, but covered for some distance on the eastern declivity with a crust of secondary rocks. The base of these mountains is skirted by a range of naked and almost perpendicular rocks of sandstone, visible at the distance of several miles, and resembling a vast rampart, erected to guard the approaches and intercept the view of the main ridge. The whole appears as if it had been broken off from the mass, and thrown into its present position, by some great convulsion of nature. These, and other ridges of sandstone found in the neighbouring plains, often assume the form of ruined towers and castles; and like similar objects in the plains of Russia and Africa, might be mistaken by a careless traveller for the remnants of ancient works of art.

32. The lower portions of these mountains are covered with a scattered growth of dwarf pines, cedar, and oak, and exhibit a very rugged and broken aspect. Above the limit of woody plants it is almost wholly naked; the soil is very scanty, and on the highest, or Long's Peak scarcely a lichen or moss is to be seen. Here the limit of snow was found in midsummer. It has been already observed, that the summits of the chain are generally covered with snow in latitude 42° and of course cannot be less than 8000 feet in elevation. Some which were observed farther north, seemed to be snow-clad almost to their bases. The highest points ascertained in this part of the chain are Long's or Highest Peak, 12,500 feet; and James's Peak, 11,500 feet above the level of the sea, situated near the sources of the Arkansaw and Platte rivers, in latitude $41^{\circ}. 30'$.

33. North of the sources of the Missouri we have no account of these mountains, except from the tour of that accurate and intelligent traveller, Sir Alexander Mackenzie. From him we learn that in his route to the Arctic Ocean, he found them extending northward in the same direction, until they terminated near the mouth of Mackenzie's river, beyond 65° , north latitude. They appear, in this part of their course, to diminish

in elevation, but still rise to the limits of perpetual snow, which is lower in these latitudes and retain the other characteristic appearance of the range. Their structure is not known; but there is no reason to doubt that they are still composed of primitive rocks.

34. In reviewing the whole course and character of this great range of mountains, we shall find it surpassing most chains of the old continent in dimensions and grandeur. It extends without interruption for the distance of 7000 miles, and seems like the spire of the continent it traverses. Commencing with moderate elevation at the south, it soon spreads into so wide and elevated a plain, that cities and empires may be founded on its expanded mountain tops; and this is again crowned with lofty summits, which, if they were placed even on the ordinary level of the earth, would be deemed vast mountains. The grandeur of this part of the chain is increased by the volcanic character of its peaks. Popocatapetl, the loftiest, is continually burning; Orocaba, Turtla, and Colima, have occasional eruptions; and this region was the scene of one of the most remarkable events in the natural history of the earth which is upon record, the formation of the large volcano of Jorullo. During a series of earthquakes and other convulsions, which occurred in 1759, at the distance of 180 miles from any active volcano, this new volcano was thrown up by the heavings of the earth upon a plain to the height of 1500 feet, surrounded by five less elevated cones, and thousands of small ones, all of which threw forth fiery eruptions. Jorullo is still burning, and throws out large quantities of lava from its sides. The Mexican Cordillera is not less distinguished for its mines of gold and silver, the proverbial standard of immense wealth, which have recently given new energy to enterprise, and new violence to the mania of speculation in Great Britain. In going northward we still find the singular combination of a level country at a mountainous height; and travel with the same ease at two miles above the level of the sea, as on the sands of its shores. On passing the parallel of 30° , the table-land extends in breadth as it diminishes in height. In place of a fertile cultivated country, we find a dry and barren desert; and the mountains, rising in a more obvious and regular manner from its level, pursue their course to the north with more of the rugged and dreary character which we associate with a chain. Being uninhabited it forms an almost insurmountable barrier between the two portions of the continent. We know nothing of its mineral treasures beyond the Mexican peninsula; but its snows and springs supply those vast rivers and chains of lakes which water and fertilize more than two-thirds of North America, and confer more certain and permanent wealth than the mines of Mexico.

35. Along the coast of the Pacific Ocean there is another chain of mountains nearly parallel to the Chippewan, and forming a kind of secondary range or step between these and the ocean. It extends from the cape of California across the Columbia river near its mouth, about 3000 miles, as far north as the coast has been examined.

In the southern part it attains no great elevation, being only 4500 feet high in California. La Perouse states that the northern part rises to the height of 10,000 feet, and is covered with snow and glaciers. At the northern extremity is mount Elias, one of the loftiest peaks of North America, rising nearly 18,000 feet above the level of the sea. This portion of the chain has a volcanic character. At Port Bucarelli, in latitude 55°, a Spanish voyager saw seven volcanoes, whose summits were crowned with snow, throwing out flames and ashes; and at Prince William's Sound, in latitude 60°, volcanic eruptions were also witnessed. Mount Fairweather is next to mount Elias in height, being nearly 15,000 feet above the level of the sea. Between 40°. and 50°. of latitude, several prominent points are laid down by Lewis and Clark, two of which, on the south of the Columbia river are called Mount Jefferson and Mount Hood; and three on the north, Mount St. Helens, Mount Regniere, and Mount Baker, the last being near the straits of St. Juan de Fuca. The two former are covered with perpetual snow, and therefore cannot be less than 7000 feet in height.

36. There are no considerable branches proceeding from the great western chain, except those which pass off from it to the east and west in Mexico. It is obvious that there must be an elevated tract or ridge of land proceeding from it on the north, and dividing the waters of the northern declivity from those of the United States. It has been supposed that there is a chain of mountains passing across to Hudson's Bay, and thence around its southern extremity, until it unites with the chain which passes through the middle of Labrador; but of this we have no good evidence. The high lands in the basin of the Mississippi are too little connected with this great range to be considered as branches. It appears to be flanked on the western, as well as the eastern side, by an elevated table-land of a desert and dreary character.

37. The Appalachian chain stretches the distance of 900 miles from south-west to north-east, along the eastern coast of North America, generally at the distance of 50 to 100 miles. It may be considered as rising on a confused group of mountains on the borders of the Alluvion, or the southern coast of the United States, in the north-eastern part of the state of Georgia. It proceeds in a series of parallel ridges through the states of Carolina, Virginia, Maryland, and Pennsylvania. In New York and New Jersey, the chain appears somewhat broken, but still may be traced by a series of groups and ridges, of similar structure to the ranges of New England; and thence to the White Mountains, and the mountains of Maine, which divide the waters of the Atlantic and the St. Lawrence.

38. The principal or central ridge of the southern portion is the Allegany; and sometimes its name is employed to indicate the whole chain. It commences in the northern part of Georgia, under the local names of the White, Smoky, Bald, Iron, and Yellow Mountains. On entering Virginia it assumes the name of the Allegany Ridge, which it retains during its passage through this state and Maryland, to its apparent termination

in the interior of Pennsylvania. A range of high lands may, however, be traced through the northern parts of Pennsylvania and the state of New York, to the mountains lying on the west of lake Champlain. The western portions of Virginia and Pennsylvania are occupied by several secondary ridges, of which the principal are the Laurel and Chesnut ridge. Two considerable branches from the west unite with the Allegany ridge in Virginia; the Clinch mountain from the southern side of the Tennessee river, and the Cumberland mountains, which commence near the entrance of the Tennessee and Kentucky rivers, into the Ohio, separate their stream through their whole course.

39. The Blue ridge is a lower and subordinate portion of the Appalachian chain, but longer than the Allegany. It lies between the Allegany ridge and the ocean, and forms the first step from the low and alluvial, to the elevated and primitive country. It commences near the same spot with the Allegany ridge, and traverses the Atlantic states in a direction verging more to the east, until it terminates in the high lands of the Hudson river, of which the most remarkable point is the precipitous bluff, on which the strong fortress of West Point is situated. During a part of its course through Pennsylvania, it is called the north mountain, but again assumes the name of the Blue ridge on the north-east; and is known by no other but local designations in its passage through the states of New Jersey and New York. In crossing the Hudson river the direction and name of the Blue ridge is lost; but it is still connected by the Taghonnui and Saddle mountains with the masses of primitive mountains which traverse the New-England states.

40. The various ridges of mountains which form the continuation of the Appalachian chain east of the Hudson river, run more directly from north to south than other portions of the chain; but they are still connected by lateral spurs and ridges in a series of steps, tending on the whole toward the north-east, in a direction parallel to the coast. They may be reduced to two principal portions, the Green mountain and the White mountain ranges.

41. The Green Mountain range commences on the northern shore of Long Island Sound, and passes directly north on the eastern side of the Connecticut river, until it unites with the height of land which bounds the basin of the river St. Lawrence. The White Mountain range originates on the same coast, in several ridges connected with the former by lateral spurs, which centre in the principal group of the White Mountains in the State of New Hampshire. Branches proceed with a gradual diminution of height from these to the mountains of Maine, and in several directions towards the highlands, which separate the waters of the United States from those of the St. Lawrence, and which have been recently surveyed, with a view to the final settlement of the boundary between the United States and the British possessions.

42. The breadth of the Appalachian chain is, according to computation, from 100 to 150 miles; its general course, as already observed, is parallel

to the coast. It ranks among the longest mountain chains; but is surpassed by most others in height. None of its summits rise to the limit of perpetual frost; and few attain the elevation which prevents the growth of forests. South of the Hudson River, the average height does not exceed 1000 to 2000 feet. The highest peaks in this part of the chain are, the Table Mountain in South Carolina. Otter Peak in Virginia, and Round Top, in the subordinate chain of the Catskill mountain, which do not exceed 4000 feet in height. Table Mountain has a lofty perpendicular front of granite, 900 feet in height, extending a mile in length: viewed from the valley, it appears like an immense wall rising up to heaven; and the involuntary awe it inspires is increased by the bones of animals destroyed in falling from the precipice, which are strewed at its base.

43. The general aspect of these mountains is not of that bold and rugged character which is found in most of the ranges of Europe. The summits are generally rounded, the declivities are not steep, nor are the passes rugged and difficult; instead of conic peaks and a sharp serrated outline, they present long and level ridges. The sides furnish many fertile spots; and the ridges are frequently separated by broad and fertile valleys, or flanked by level table lands. Some of the richest districts of Virginia and the Carolinas are situated among the mountains; and in consequence of the elevation, the coolness and salubrity of the northern states are extended into the southern. The most elevated ranges are composed of primitive rocks; others are of secondary origin. They furnish a variety of valuable building stones, but no extensive mineral treasures. Some of the mountains of New England are composed of trap, and exhibit the perpendicular precipices with a columnar structure which belong to the formation, and are finely exemplified in the Calton Hill at Edinburgh. But they are generally primitive, and exhibit something of that ruggedness which is peculiar to the older rocks. The loftiest points of the Green Mountains are Mansfield Mountain, and Camel's Rump, in Vermont, about 4000 feet in height. Saddle Mountain in Massachusetts is a spur of the same chain, and about the same height. It is six miles in length, and forms the highest point in Massachusetts, visible at a great distance from the neighbouring states.

44. The White Mountains of New Hampshire contain the loftiest summits of the Appalachian chain, and exhibit more of the Alpine character than any others in the western portion of North America. They comprise a long range of proud eminences, of which Mount Washington, the commanding peak, is 6634 feet in height. During nine, ten, and sometimes eleven months in the year, their summits are covered with snow; and in clear weather they are surrounded or capped with white fleecy clouds. These circumstances have given them their name; and render them visible at a great distance at sea, when the weather is fine. The base of the mountains is covered with forests. At the height of 4000 feet, and above the region of cultivation, it is surrounded with a zone of shrubby evergreens, so

thickly set as almost to furnish a passage over their tops. A succeeding zone extends some distance, which furnishes no vegetation but moss. The upper region is a mass of naked rocks. The various peaks are separated by deep chasms sometimes winding for a great distance between perpendicular walls of naked rock. The most remarkable of these is termed the Notch or Gap. It is a deep narrow defile on the western side, extending nearly two miles in length, and between lofty precipices in one part only twenty-two feet wide. The mountain appears as if cloven at its base, with a perpendicular cliff on one side, and on the other a declivity of forty-five degrees. The scene is rendered peculiarly sublime by the great depth of the chasm, and the striking assemblage of rocky ruins scattered through every part of it. The streams which descend from their summits fall in numerous cascades from their precipices, and various portions of the group present the most romantic and sublime mountain scenery.

45. It will be useful to present at one view, the height of the most elevated mountain peaks in North America, in connection with those of corresponding elevation on the old continent. The number is small whose height has been accurately ascertained.

WESTERN OR CHIPPEWAN CHAIN.

The loftiest are exceeded only by the Himma-leh Mountains of Asia, and the Andes of South America

Mount St. Elias	17,875
Vol. Popocatepetl, or Smoking Mountain	17,720
Vol. Pic de Ouraba, also called Cittapetl., or Star Mountain	17,370
Iztaccihuatl, or White Woman	15,700
(Mont Blanc, highest of the Alps, 15,662.)	
Nevada de Toluca	15,165
Limit of perpetual snow, lat. 20°	15,091
Mount Fairweather (North-west coast)	14,992
Cofre de Perote, or Nacihcampatepetl	13,415
Long's, or Highest Peak (United States)	12,500
James's Peak (United States)	11,500
Mine of Real del Monte	9,125
(St. Gothard, a summit of the Alps, 8,930)	
City of Mexico and surrounding table-land	7,470
(Hospital of St. Gothard in the Alps, 6,807.)	

EASTERN OR APALACHIAN CHAIN.

Otter Peak , Blue Ridge, Virginia	3,950
Highlands on the Hudson River, New York	1,385 (<i>Rock of Gibraltar</i> , 1,500.)
Blue Mountains , Connecticut)	1,000

47. **PHYSICAL DIVISIONS.**—The great mountain chains of North America, and their connecting highlands, divide it into four principal portions, intimately connected with the water-courses we have described: 1. The eastern, or Atlantic declivity of the Appalachian chain, between these mountains and the ocean. 2. The great central basin of the Mississippi, or the southern declivity, pouring its waters into the gulf of Mexico. 3. The western declivity of the Chippewan mountains, lying between that chain and the Pacific Ocean; and 4. The northern, or Arctic declivity, lying between the Arctic ocean and the highlands which give rise to the waters which flow into it. The basin of the St. Lawrence, which lies between that of the Mississippi, and the northern declivity, and the table-land of Mexico on the south also require distinct consideration, on account of their peculiar features and individual importance. The two great chains of mountains, as we have already noticed, are chiefly composed of primitive rocks. The primitive ridges of the Appalachian chain spread in its northern part, and form an extensive tract of rugged primitive country, covering the whole of the states east of the Hudson and a part of New York. The coast of the Atlantic is bordered with an alluvial tract which extends westward to the foot of the Appalachian chain, and passes round the whole coast of the gulf of Mexico. The great central basin is entirely secondary. The structure of the northern and western declivities is not so well known; but there is some reason to suppose that the secondary region extends northward from the gulf of Mexico to the Arctic Ocean.

48. The eastern or Atlantic declivity of North America is occupied exclusively by the maritime portions of the United States, and the small British provinces of Nova Scotia and New Brunswick. It comprises a primitive region between the Hudson River and the Atlantic, including the eastern, or New England States, and the British provinces; and an alluvial region stretching south of that river to Cape Florida. The Eastern States, which comprise nearly all the extended primitive country of the United States, present the usual irregularity of surface in their formation. A small portion only in the states of New Hampshire and Maine exhibit the rugged and dreary aspect of the Alpine regions of Europe. Some districts are crossed by ridges of mountains, which give them a bold and picturesque character, without rendering them unproductive, or presenting insurmountable obstacles to cultivation; as in the state of Vermont, and the range of country south of it, con-

nected with the Green Mountains. The greater part of this region presents a surface continually undulating, and agreeably diversified with hill and dale. In approaching the coast it becomes more level, but rarely spreads into a plain of any extent. The country is finely watered by springs and rivulets, which flow from numerous hills, and wind through almost every valley. It abounds also in lakes, which an American writer, who has travelled over most parts of the region, estimates to exceed 1000 in number, or a surface of 70,000 square miles; and, as there are no stagnant waters in so uneven a country, they contribute to the salubrity of the air, as well as the fertility of the soil. The largest lakes are St. Winnepisiogee in New Hampshire, twenty-seven miles long, and ten broad; Lake Umbagog, about the same size; Moose Head Lake in Maine, sixty miles in diameter; and Memphrenagog in Vermont, forty miles in length. Most of the lakes and streams are termed small, from their vicinity to others of unusual magnitude; but they are large when compared with those of Great Britain. The borders of the lakes are commonly distinguished by the wilder beauties of scenery, and are free from the aquatic vegetables which often deform and corrupt the stagnant waters of alluvial countries. The streams usually have a descent, which renders them valuable for mechanical purposes, while it obstructs their navigation. They abound with interesting falls and beautiful cascades; and there are a few cataracts of considerable grandeur, although far inferior to that sublime object which is here the standard for this species of scenery—the Falls of Niagara.

49. The soil of the eastern states is productive, but from the unevenness of the country it is better adapted to pasture than tillage; and laborious and skilful husbandry is necessary to render agriculture profitable. The vales of the rivers and streams are usually overflowed once or twice a year; and the alluvions thus formed and fertilized, which are termed in America intervals or bottom-lands, are cultivated year after year with scarcely any manure, and present a luxuriance of vegetation, and a richness of crops, which is no where surpassed in temperate climates. The vale of the Connecticut River, which accompanies it almost through its whole course, is distinguished for the beauty of its scenery. The banks are frequently bordered with a fringe of trees or shrubs. The intervals, or portions of the vale, divided by highlands or mountains, which touch upon the river, are fields of various extent, from 500 to 5000 acres, rising in terraces as they recede, and presenting every species of vegetation. A large portion is occupied by natural meadows, interspersed with lofty and beautiful forest trees, and occasionally diversified with orchards. Another division is covered with the various crops of the climate, with no visible lines of separation except the diversity of hue. Not a spot of waste or neglected ground is seen. When viewed in connection with the majestic river and its numerous tributaries, the villages scattered on its banks, and to gradual change from the rich cultivated valley of the rough declivities and forested sunmits the

the hills and mountains which bound it, nothing seems to be wanting to the completeness and beauty of the landscape.

It ought to be mentioned, to prevent any confusion concerning the geology of this region, that it contains several tracts of secondary formation. A strip of what is usually called transition rocks is found east of Lake Champlain; another extends from Rhode Island to Boston; and another narrow strip, from the Delaware to the Yadkin River. A secondary region extends from New-Haven, along the Connecticut River, to Vermont; and another from the Hudson to the Rappahannock, which covers the primitive in New Jersey. Richmond has a secondary coal formation. The banks of streams, lakes, &c., of course present many examples of limited alluvions.

50. The alluvion of the eastern declivity commences on the southern shore of Long Island, and extends between the Atlantic Ocean and the primary ridges of the Appalachian Chain, until it passes round the southern extremity of these mountains, and unites with the basin of the Mississippi on the shores of the Gulf of Mexico. A remarkable granite, or gneiss ridge, forms the boundary between the primitive and alluvial formation, which is believed by some to have been the ancient line of the sea coast. It crosses Long Island Sound, Hurlgate near New York; the Delaware at Trenton; the Susquehanna at the rapids near its mouth; the Potomac at Georgetown; the Rappahannock at Fredericksburg; James River at Richmond; and the Roanoke at Halifax; producing rapids or falls in all these streams, except the Potomac, which obstruct navigation. The boundary continues by Raleigh and Columbia, nearly parallel to the coast, to Augusta on the Savannah River, and thence to Natchez on the Mississippi.

51. The shore is low and sandy. Its elevation gradually increases in proceeding south. The tide extends through the alluvion to the foot of the mountains, on all the rivers north of the Roanoke; but, below this, it does not reach the western boundary. Through the whole region there is very little that deserves the name of rock. The great mass below the soil is composed of sand, gravel, pebbles, shells, clay, and marl; the last of which sometimes forms extensive beds.

52. A bed of shells, sometimes cemented into shell-limestone, extends from Eutaw Springs on the Santee River, to the Savannah River, and the Chickasaw Bluffs, on the Mississippi. It is 600 miles long; from 10 to 100 broad; and in some parts 300 feet thick. In other parts, the gravel and sand are converted into a loose, friable sandstone. Remains of vegetables are found at the depth of 100 feet in various places. The character of the alluvion varies according to the nature of the countries lying at the head of its streams. The portion north of the Potomac, including Delaware and a part of Virginia, is also watered by streams which flow from secondary mountains and render the alluvion very fertile. The streams south of the Potomac flow from the primitive portions of the Allegany Ridge, and bring down only sand, or gravel, or the hard materials of primitive rocks, which produce a more

steril soil in Virginia, North and South Carolina, and a part of Georgia.

53. In these states, the tracts which are low and moist are soon covered with vegetation from the heat of the climate; and the accumulation of vegetable soil renders them peculiarly fertile. The same heat renders the dry tracts more sterile; and there is a greater contrast between the rich and poor soils in this region than in colder climates.

54. The borders of the streams are often mere swamps, extremely rich and well adapted to the cultivation of rice, but productive of the most noxious effluvia. The more elevated tracts are too sandy and arid to permit the growth of any forest trees except the pine.

55. The central portion of the continent, extending from the Apalachian mountains on the east, to the Chippewa range on the west; and from the gulf of Mexico on the south, to the sources of the streams which flow into the Arctic Ocean on the north, is occupied by a vast basin almost uniform in its geological character and general features. It extends through more than twenty degrees of latitude, and thirty of longitude, covering a surface of 1,300,000 square miles. The northern part is occupied by the great chain of lakes and rivers which form the St. Lawrence; but nearly all the waters of this immense region are poured into the single stream of the Mississippi, and find their way to the ocean by its outlet, giving just ground for calling it the basin of the Mississippi. By means of this great stream and its branches, one of the largest upon the globe, it enjoys an extent of inland navigation, emanating from a single centre, which is almost peculiar. It is entirely a region of secondary rocks, and therefore a large part of it is characterized by peculiar fertility; while the extent of latitude it embraces renders it capable of furnishing most of the productions of hot and cold climates. The barriers, which separate it from surrounding countries, seem to designate it as the seat of a great empire, while they forbid the inhabitants to attempt foreign conquests. The vast internal resources, and the easy communication through every part, will render it peculiarly independent of foreign aid; and the small extent of sea coast will almost secure it from the dread of a foreign invasion. It is rapidly filling with emigrants from the maritime United States, and has been traversed in several directions by men of intelligence; but we are still imperfectly acquainted with a large part of it, especially on the north and north-west.

56. For the sake of greater accuracy we shall describe this extensive tract in three principal divisions. The Delta of the Mississippi, and the neighbouring alluvion of the gulf of Mexico; the eastern section lying between the Mississippi and the Apalachian chain; and the western section, extending from the river to the Chippewa mountains. Before we proceed to the description it will be necessary to explain one of the great natural features of this continent, those extensive grassed plains, termed prairies. The eastern section of the continent, from the gulf of Mexico to the 55° north latitude between the At-

lantic, and to lake Erie; the Ohio and the lower part of the Mississippi was originally, with few exceptions, covered by a dense forest; it was the largest probably upon the globe, and only a small part of it is yet destroyed. It extends fifty or one hundred miles beyond the lower Mississippi, and into a part of the state of Ohio; but here the whole aspect and character of the country is changed: it would seem as if some extensive conflagration had not only swept away every vestige of a forest, but had even exterminated its seeds, and destroyed the capacity of the soil to rear trees. The eye traverses extended plains where not a shrub is to be seen, usually waving with long grass, and presenting not a single object to interrupt the view or diversify the scene, except the birds and animals which may be feeding upon them; they furnish no marks by which to estimate the distance or size of any thing which may be visible, and the inexperienced traveller is often deceived in the most ludicrous manner. A series of these prairies of various extent, continues to the foot of the Chippewa mountains, interrupted occasionally by streams and hills, or studded with mountains, but generally presenting the most striking and dreary uniformity of scene. Many of them are entirely destitute of stones, and scarcely any wood is to be found, except in narrow strips on the borders of the streams.

57. The district east of the Mississippi which borders immediately on the Delta, embracing the greater part of the state of Mississippi, and Alabama, has a large portion of the most fertile land, and is adapted by its climate to furnish the richest products of agriculture. A part of it consists of river alluvion, but the greater part of the elevated or hilly tracts are termed bluffs. Agreeably to the usual characteristics of hot countries, there is scarcely any soil which holds a middle place between the best and the worst; the climate rendering those tracts quite sterile which are not sufficiently supplied with moisture. The greater part of this district is hence covered with that light soil which produces forests of dwarfish pines. Still the fertility of the remainder, and the importance of the staple production, cotton, renders it one of the most valuable tracts in the United States.

58. In the middle of this part of the basin is a mountainous section, connected with the Cumberland mountains, already described, embracing the greater part of Kentucky and Tennessee, and the western parts of Virginia and Pennsylvania, between the Ohio and the Allegany mountains. It abounds in hills, elevated near the Ohio, from 400 to 1000 feet above the river, and higher in the neighbourhood of the mountains. It is based upon limestone, which gives great fertility to its soil; but is so much broken by fissures and caves, that it is liable to extreme drought in the summer by the sinking of the water. It is in some degree rugged; but enjoys a temperate, healthy climate, and is capable of a high degree of cultivation.

59. The northern section of this part of the basin, between the Ohio, the Mississippi, and the lakes, embraces the states of Ohio, Indiana, Illinois and the North Western Territory. It may be divided into three portions; the hilly country,

the plain country, and the valley country, besides the peninsular territories of Michigan and Wisconsin. The hilly country occupies about one-third of the surface, extending from the Allegany Ridge, and the hilly country of New York and Pennsylvania, to the ridge running from the mouth of the Wabash to the eastern part of Lake Erie, which divides their waters from the branches of the Ohio. Its surface is uneven, and in many places rugged and broken; but a large part of it is susceptible of cultivation. No high mountains are to be seen. The hills usually rise from 600 to 800 feet above the common level, which is about 1000 feet above the level of the streams, or the water-table of the country. They invariably present rounded summits; and the soil is generally productive. Numerous fine tracts are interspersed among the hills, and the valleys of the streams are extremely fertile. The banks of the streams are usually abrupt and precipitous, and the channels deep.

60. The plain, or undulating country, extends from the hilly region to Lakes Erie and Michigan, and the Fox and Wisconsin rivers. On entering this section, the land gradually changes from a rough, to an undulating surface; not entirely destitute of hills, but rising into broad and gentle swells in some parts; and subsiding into extensive plains in others. Three-fourths of this region is occupied by prairies or savannahs, remarkable for the richness of their soil, yielding a spontaneous and luxuriant growth of herbage; but only skirted with trees. It is so nearly level that the streams flow sluggishly; the water of rains stagnates on the surface, and the exhalations render the air moist and unhealthy. Extensive tracts are well adapted for settlement; but many parts of the country must remain uninhabited for many years, on account of the scarcity of timber, and the deficiency of mill-seats and springs.

61. The valley country embraces the alluvial tracts in the river-vales of the preceding divisions, usually called bottoms. They are composed of alternate layers of sand and soil, deposited by the streams; and vary in fertility, according to the nature of the formation from which the streams originated. In the vale of the Ohio, the quality of the soil appears to improve from its source downward. The climate of the valley country is, almost without exception, unhealthy; but cultivation will gradually diminish, and perhaps remove, the causes of disease, by clearing the land of putrefying vegetation. The most extensive tract of valley country east of the Mississippi, is the American Bottom, extending about 81 miles on the Mississippi, from the Kaskaskias, to the Missouri. Its average breadth is four miles; and it is considerably elevated above the present level of freshets. It is generally very rich; and is destitute of timber, except on the margin of the river. Other bottoms of great extent are found below the junction of the Missouri. The Ohio bottoms are uniformly covered with deep forests, and have no prairies of importance. The valley of the St. Lawrence seems, from its geological character and general aspect, to be only a branch or portion of the basin of the Mississippi, and may at

least be advantageously considered in connection with it.

62. The general characteristics of the peninsular territories of Michigan and Wisconsin, are similar to those which have been described. The land appears to be more elevated and less abundant in streams. The Wisconsin, or north-west territory, is crossed by a wide range of hilly or broken country, commencing on the Wisconsin river and extending to Lake Superior; and called by Major Long the Wisconsin Hills. In geological character and metallic production they appear to resemble the Ozark mountains, which will soon be described, and probably belong to the same formation. The remainder of this basin is a narrow tract, lying on the lakes and the St. Lawrence; bounded on both sides by ranges of highlands which separate its waters from those of the surrounding declivities. It resembles the vale of the Mississippi to a considerable extent, in its geology and soil, from Lake St. Clair to Montreal. The northern parts of the state of Illinois, Indiana, Ohio, and New York, and the north-eastern part of Pennsylvania, which belong to this basin, are generally level, and equal any part of the United States of the same extent in fertility.

63. The western section of the great central basin, lying between the Mississippi and the Chippewa mountains, form the greater part of the territory formerly purchased by the United States, under the name of Louisiana, comprising the state of Missouri, and the territories of Arkansas and Missouri. The southern portion is traversed by a range of mountainous country, recently surveyed, which are called the Ozark Mountains, and the northern is divided by the Missouri.

64. The country lying between the Mississippi and the Missouri, above their junction, contains no mountains of any magnitude. It is not destitute of abrupt hills and precipices; but is characterised by a rolling, undulating surface, variegated by broad river vales, and tracts of upland. It is generally destitute of forests, and only chequered with stripes of woodland on the borders of the streams. The bottoms on the Mississippi and Missouri are very rich, and generally covered with timber; but prairies become more numerous on going upward from their junction. The soil of this region is probably equal, if not superior, to that of any other tract of upland in the United States; but the scarcity of timber, mill-seats, and springs, must for a long time impede its settlement.

65. The tract extending south of the Missouri, to the Red River, between the Mississippi and longitude 96° west, has a surface much diversified. An extensive bottom lies on the Mississippi, extending from the Ohio to the Red River, which contains large swamps of cypress trees, almost impenetrable from the undergrowth of shrubs. The Great Swamp, the most considerable, commences near the head of this tract, and stretches about 200 miles in length, and from five to thirty in width. The lowlands lying immediately on the Mississippi, are bounded by a chain of heights, corresponding in some degree to the bluffs on the river, which form the com-

mencement of a tract of broken and hilly country extending from 300 to 400 miles west. The vales on the Missouri and Arkansaw, and their branches resemble the country north of the Missouri, in the prevalence of prairies and the undulations of its surface. With these exceptions, the whole tract is very rough, presenting numerous peaks and cliffs of considerable height. The central portion forming a mountainous district, and resembling many portions of the Appalachian chain in appearance, has received the name of the Ozark Mountains, from the late expedition.

66. The Ozark Mountains extend from the Spanish province of Texas, across the Red and Arkansaw rivers, in a north-easterly direction towards the confluence of the Mississippi and Missouri; and thence are continued on a low range of hills to the Wisconsin Hills, and Lake Superior. The lead and copper with which they abound, is found throughout the whole distance; and the continuance of the same peculiar geological character indicates that both are parts of a single district formation. The range consists of low ridges, irregularly placed, interspersed with detached hills, and rarely rising more than 1500 or 2000 feet in height. The general course is the same with that of the Appalachian chain. Like them they have a basis of primitive, covered, and often crowned, with secondary rocks, usually forming rounded summits, and sometimes presenting perpendicular cliffs and abrupt precipices. They are covered with pines and dwarfish trees of other kinds, and have a dreary aspect compared with the surrounding country. The whole breadth of the range is from 100 to 150 miles. They give rise to a number of considerable streams, which flow into the Mississippi, Missouri, and Arkansaw. They may be considered as extending on the west, to a line drawn from the confluence of the Canadian with the Arkansaw river on the south-west, to the north of the Wisconsin river on the north-east.

67. From the base of the Ozark mountains, just described, an immense sterile desolate plain extends for twelve degrees of longitude, to the foot of the Chippewa range; which, from its being the first example of this kind found upon the continent, has been called the Great American Desert. The hilly country gradually subsides to a level but undulating surface, with nothing to limit or variegate the prospect but here and there an insulated hill or tract of table-land. The latter sometimes rise 600 or 800 feet above the common level, surrounded in many instances by rugged precipices, and add to the singular appearance of the region; their surface is usually waving, often nearly bare, but sometimes covered with stunted trees. The soil consists of fine granite sand, intermixed with the remains of organized beings, and sometimes not furnishing a rock or stone for hundreds of miles. It is almost entirely destitute of timber; a scanty growth of grass is the only covering, and large tracts are often met with which exhibit scarcely a trace of vegetation.

68. The streams are broad and shallow; and, running through a bed of sand, are liable to become dry in the hot season. The valleys of the

rivers and creeks are usually sunk 150 or 200 feet below the common level of the country; they are bounded in some places by perpendicular precipices; and in others by bluffs or banks of gentle slope. Many of them are rich, especially near the mouths of the rivers; but towards the sources become sterile; and the salts and magnesia mingled with the soil are often so abundant as to destroy vegetation entirely. The waters are to a great extent impure, and frequently too brackish for use. The valley of the Canadian river is incrusted to a great extent with salt nearly pure, resembling ice or snow in its appearance. The waters of the river are so impregnated with salt as to be unfit for use; and this is the case with other tributaries of the Arkansaw and the Red River. These streams are also tinged with a deep red, from the soil over which they grow. On approaching within 100 miles of the Chippewan mountains, their snow-capped summits become visible. Here the hills become more frequent, elevated rocks more abundant, and the soil more sterile; until we reach the abrupt chain of peaks which divides it from the western declivity of North America. Not a thousandth part can be said to have any timber growth, and the surface is generally quite naked.

69. The region we have been describing approaches more nearly to the steppes of Tartary than any portion of North America. Scorched in summer by the reverberation of the rays of the sun, and chilled in winter by the freezing winds which blow over it without interruption, it presents no shelter or attractions to civilized man, and is occupied entirely by herds of bisons and wild horses, and a few roving bands of Indians, who subsist upon the game it supports. In regard to this extensive 'section of country,' says Major Long, 'we do not hesitate in giving the opinion that it is almost wholly unfit for cultivation, and of course uninhabitable by a people dependent upon agriculture for their subsistence. Although tracts of fertile land, considerably extensive, are occasionally to be met with, yet the scarcity of wood and water, almost uniformly prevalent, will prove an insuperable obstacle in the way of settling the country. Agreeably to the best intelligence which can be had, the vast region commencing near the sources of the Sabine Trinity, Brasis and Colorado, and extending northwardly to the forty-ninth degree of north latitude, by which the United States territory is limited in that direction, is throughout of a similar character. This region however, viewed as a frontier, may prove of infinite importance to the United States, inasmuch as it is calculated to serve as a barrier to prevent too great an extension of our population westward, and to secure us against the machinations or incursions of any enemy that might otherwise attack us from that quarter.'

70. The waters of the vast basins we have been describing, are all discharged into the gulf of Mexico, through a tract of 700 miles in extent, consisting of alluvions formed by their deposits; and which, from the importance of the principal stream, may be designated the Delta of the Mississippi. This singular Delta, with

its adjoining alluvion, contains perhaps as great diversity and extremes of soil as any portion of the globe of equal extent, from the most sterile to the most productive. The Gulf is bordered by an extensive marsh or swamp, which forbids all settlements immediately upon the shore. It extends to the distance of twenty or thirty miles, is destitute of trees, and covered with a coarse species of reed, four or five feet high, presenting the most dreary prospect to the ships which pass through it on their way to the ports upon the rivers; and forming not merely a barrier to improvement, but a source of pestilence. The south-western portion of the state is occupied by extensive prairies, bordering upon the sea-marsh, admirably adapted to the rearing of cattle. Thousands are fed here continually, and the district is almost exclusively inhabited by the herdsmen. Beyond the prairies, with the exception of the river alluvions, the greater part of the country is occupied by pine forests, which indicate a soil difficult of cultivation, and only likely to be occupied when there shall be an overflow of population. In some parts east of the Mississippi they descend to the water's edge. The remainder of the region is occupied by river alluvions, which, from the structure of the country, are divided into two portions, river-borders and the interior plains. In their annual inundations, the streams deposit their coarser and heavier portion of the alluvion immediately upon the banks, and have produced a loose but fertile soil, elevated above the level of the surrounding country, and ultimately above the common floods. In passing into the interior only the finer and argillaceous particles are left, forming a hard and stiff surface, which is annually overflowed, and continues covered with water after the river has subsided; and when laid dry is almost as solid as stone, and ill adapted for cultivation. These interior tracts, usually but erroneously called swamps, are equally unfit for habitation or cultivation; and the only lands which can strictly be called arable in this region are the alluvial river borders. Their extent is comparatively small; and in this respect the Delta of the Mississippi is essentially different from the continuous region of fertility at the mouth of the Nile. But the richness of their soil in the luxuriance of their natural products, and the value of their crops, seem to be a sufficient balance for their united extent, and place this region among the most productive of North America. It is constantly extending into the Gulf of Mexico, from the alluvion brought down by the ordinary current and annual floods; and its importance must be greatly enhanced, as population increases in the great basin, of whose products it must be the chief market, and whose wants it must in a great measure supply.

71. The northern or arctic declivity of North America has been examined by few travellers, and our knowledge of it is very imperfect. We are ignorant, particularly, of the nature of the boundary on the south. Many have supposed that a range of mountains divide the waters of the Mississippi from those of the northern streams; but the best information leads us rather to rely on the old statement, derived from

the natives, that four of the largest rivers of the continent, the Mississippi, St. Lawrence, Saskatchewan, and Columbia, have their sources in the same plain. According to the statements of Col. Dixon, and others who have traversed the country between the Missouri and the Arsinibon River of Hudson's Bay, no elevated ridge is to be seen; but, on the contrary, tributaries to both these streams rise in the same champaign country. The general appearance of the country near the sources, and of these great streams, and north of the great lakes, favours this idea. The water-courses are generally chains of lakes; and stagnant pools and lakes are scattered in every direction, without any indications of the declivity produced by a chain of mountains, and afford strong evidence that it is an extensive plain, little inclined on any direction. Hence, it has been inferred, that it is merely a portion of an immense region of flat country, embracing the central basin, and extending northwardly from the Gulf of Mexico, between the two great ranges of mountains, and spreading, as they diverge, to the Atlantic, on the east, and the Arctic Ocean on the north. The same geological formation may be traced from the St. Lawrence to the sources of the northern streams. The extensive division north of these great lakes, as far as it has been examined, has a dreary level surface—a sterile, and generally arid soil; and an inhospitable climate, which gives it a striking resemblance to the frozen wastes of Siberia. Its only products of value are the furred animals; and the few Indians that wander over it obtain but a scanty and precarious support.

72. The western declivity of North America is among the least-explored portions. A few travellers have crossed it in the Spanish territory two centuries ago; and a single expedition, under the command of Lewis and Clarke, examined the Missouri, and the country between its source and the mouth of the Columbia River; and a few hunters and fur-traders have occasionally travelled over the northern portion.

73. We have reason to believe that the southern part of the declivity, above thirty degrees of latitude, contains an arid sterile region of the same character with that on the eastern side of the mountains; but we have no means of estimating its extent. The Mexican provinces below this latitude are productive countries, well adapted for cultivation, but very thinly settled, and imperfectly described. The peninsula of California is a sterile tract, traversed by a chain of mountains, and presenting only an arid sandy soil at their base; but the province of New California, extending north of this to the territory of the United States, is a well-watered, fertile, and picturesque country; but, like other portions of the western declivity, has never been fully described. The basin of the Columbia River, which lies north of the Spanish territory, is also a well-watered and productive tract. On descending the mountains towards this river we enter on a high level plain of fifty miles in breadth, which is rather sterile. In advancing, the soil gradually becomes more fertile, and a productive country, most of which is level,

extends from 400 to 500 miles to the mountains nearest the coast. It is generally destitute of woods; but there are broad stripes of forests on the banks of the streams which furnish an ample supply. The same valley, or level tract, seems to extend northward, and was observed by Mackenzie to be 200 miles in width, in latitude 53°. This region contains a large number of Indian tribes, and is capable of supporting a considerable population.

74. Between the central basin, and the western declivity of the continent, lies the table-land of Mexico, one of the most extraordinary elevations on the globe. In Europe, Switzerland, and some of the neighbouring regions, and the interior of Spain, are considered very elevated countries. But this opinion is founded merely on the aspect of groups of summits, and collections of parallel chains of mountains. None of the plains on which they rest, or by which they are separated, of any extent, are more than from 1500 to 2500 feet in elevation. The Desert of Cobe is stated to be 5500 feet in height. But the whole interior of Mexico, extending from 18 to 40 degrees of north latitude, or more than 1500 miles in length, forms an immense plain, elevated from 6000 to 9000 feet above the sea. It appears to decline towards the north, but so gradually, that from the city of Mexico to Durango, a distance of 140 leagues, the surface maintains an elevation equal to that of Mount Cenis and St. Gothard. Beyond this place, which is 6500 feet above the ocean, the height is not ascertained; but the continuation of the same highlands, forming the base of the Chipewyan mountains, in the United States, presents a surface about 3000 feet above the level of the sea. The surface is so uniform that carriages travel with great ease as far north as Santa Fe.

75. This singular table-land presents a succession of extended plains, separated by hills which present scarcely any obstacles to be surmounted by art in the construction of a road. The ease of communication and transportation, combined with the fertility of the soil, and the richness of the mines, confer on this extensive region advantages which are almost singular; but, in common with other elevated tracts, it suffers for want of water and navigable streams. The quantity of rain is small, and there are few mountain summits which reach the line of perpetual snow, and thus furnish a reservoir for supplies of moisture. The narrowness of the continent in this part prevents the collection of a great mass of water. The lakes which abound seem to be merely the remains of extensive basins of water which formerly existed, and these appear to be annually diminishing. Springs are not frequent; and streams are seldom found, except on the declivity, or at the foot of the table land. This aridity has been increased since the arrival of Europeans; by the destruction of trees, and the draining of moist lands. Hence, many of the most elevated portions are covered with saline incrustations, and bear a great resemblance to the steppes of Asia. The declivities are exposed to humid winds, and frequent fogs, which produce vegetation of an uncommon beauty and strength; and a great

part of the region is very productive in ordinary years; and from the peculiarity of its climate furnishes the most valuable plants of different zones.

76. RIVERS AND LAKES.—In describing the rivers and lakes of North America, the first place is due to that noble stream which was called by the Indians the Mississippi, or mother of waters. It is the great outlet for the waters of central North America, and the longest river in the world, except the Amazon. Its origin must be traced to the source of the Missouri, which is the largest of the two branches composing it, and which gives its character to the stream. The Missouri rises in the Chippewan mountains, by three branches—Jefferson, Maddison, and Gallation rivers, between forty-two and forty-eight degrees north latitude. Its course is very circuitous, first bending in a curve to the north, then descending nearly south, and turning suddenly to the south-east, before its junction with the upper Mississippi. At the distance of 400 miles from the thread of navigation, it rushes through the pass which is called the gates of the rocky mountain, presenting a scene of uncommon grandeur. It is confined to a channel 450 feet broad, and runs nearly six miles between precipitous rocks, 1200 feet in height, which often overhang the stream with the most threatening aspect. After a course of more than 3000 miles, in which it drains a tract of 400,000 square miles, it is about half a mile broad, and very deep, running with a rapid and turbid current.

77. Here it is joined by the upper Mississippi, which is a broad stream, only 1300 miles in length, with clear but shallow waters. The supply it furnishes to the main stream is small compared with that brought in by the Missouri; and it does not drain more than one-third of the extent of country. The united streams of the Missouri and Mississippi, or the lower Mississippi, receives most of its waters from the Missouri, and with them its turbid appearance and rapid current. After a course of 1400 miles they are discharged into the gulf of Mexico, below New Orleans, making the whole length of the stream from the source of the Missouri, 4500 miles. There are six outlets to the Mississippi, two of which have twelve feet of water on their bars in ordinary seasons. The north-eastern passage is principally used. Below the mouth of the Red river, the stream is generally about 3000 feet in width, and twenty feet deep, flowing three miles an hour. The waters are distinguished from those of the gulf of Mexico, for some distance from the mouth. The quantity discharged is estimated at 230 millions of gallons per minute—twice the quantity discharged by the St. Lawrence, and seven times that which flows from the Ganges.

78. This great river forms the chief outlets for the waters of the interior of the continent, and contains a surface of 1,300,000 square miles, or two-thirds of the United States' territory, equal in extent to the Russian empire in Europe.

79. Of its numerous branches, the Arkansaw ranks with the first rivers of the eastern continent, and the Red river and La Platte exceed

any in Europe, except the Volga. The Tennessee, the Ohio, the Kansas, and the Yellowstone, hold the fourth rank among the rivers of the world, and many other branches rival some of the most celebrated in Europe. The banks of the Mississippi, in the lower part of its course, are annually overflowed from the effect of the rains and the melting of the snows, and large tracts of the country are covered with water.

80. Next to the Mississippi itself, the Arkansaw is the most important river of the central basin. Assuming the Missouri as the principal stream, the Arkansaw is its chief branch, ranking even before the upper Mississippi. The sources are not well ascertained, but are probably near the line of 42°. It winds through eight degrees of latitude, and twenty of longitude, a distance of 2000 miles, before it reaches the Mississippi. Its channel, from longitude 100°. W. of London, is the boundary between the United States and the Spanish possessions. This river is more impeded by falls and cataracts than most others in the basin. In the last 600 miles of its course, it flows in a deep and rapid channel 600 yards wide. The Canadian is a very large branch of the Arkansaw, nearly 1000 miles in length, which from its red colour has been hitherto supposed to be a branch of the Red river. It is remarkable that a large part of its channel is perfectly dry during the summer season, in consequence of the aridity of its basin. Red river is next in magnitude and length to the Arkansaw. It rises in the mountain prairies of New Mexico, about ten degrees south of the source of the Arkansaw, and not far to the east of Santa Fe. It pursues a winding course of 1500 miles, and enters the Mississippi near its mouth, dividing the branches of the Mississippi from the streams which flow into the gulf of Mexico. In its progress it receives a number of branches. In the lower part of its course it presents a striking peculiarity by which it is distinguished from most other streams. For a distance of 100 miles it is skirted by a series of lakes from five to thirty miles long, and a quarter to three quarters of a mile wide, which serves as a kind of reservoir to regulate the height of the water. When the stream is highest, they receive the surplus water, and when it is again depressed, they discharge it slowly, to prevent the destructive effects of an excessive flood. In some parts it is also divided into several channels, each confined within high and steep banks. Its navigation is also obstructed by an extensive and singular collection of trees and brush, called the great raft, which covers its waters, and is considered impassable by boats. This river takes its name from the colour of its water, which in times of flood is of a bright red, and partakes more or less of this colour through the year. It is doubtless derived from the red argillaceous sandstone of the Chippewan mountains, and the neighbouring region. The White, St. Francis, and several other considerable streams, empty into the Mississippi on the west, below the mouth of the Missouri; but none claiming particular notice in connexion with these great streams. Above the Missouri, the principal branch on the west is St. Peter's river: but following the Missouri as the main

stream above the junction, we find a great number of considerable branches, of which the Platte and Yellowstone are the largest.

81. The Platte, as its name imports, is almost uniformly a broad and shallow stream, fordable almost every where except when swollen by freshets. The banks are low, and yet, from the breadth of the channel, and the rapidity of the current, are seldom overflowed. Its valley is a wide plain, terminated by gravelly hills. The whole length of its course is 750 miles; and the influx of its waters gives a new character to the Missouri, which is more rapid and turbid, and more difficult of navigation, below its mouth. The principal remaining branch of the Missouri, is the Yellowstone, which joins it 680 miles below its source. Its own course is about the same; and the volume of water appears to be as great as that of the Missouri. It is 800 yards wide at its outlet, and materially increases the size of the main stream below.

82. On the eastern banks, a little above the mouth of the Missouri, the Mississippi receives the Illinois, a stream 400 yards wide at its mouth, and 400 miles in length. It rises by two branches so near the waters of lake Michigan, that it forms one of the proposed channels of communication to the lake, which will be described hereafter. It flows in a gentle current unbroken by rapids, and is bordered by a fertile country. But the great eastern branch of the Mississippi, and indeed one of the most interesting rivers of the basin, is the Ohio. It rises in the Allegany ridge, in the western parts of Pennsylvania and New York, by two branches, the Allegany and Monongahela. They unite at Pittsburg; and after an entire course of more than 1000 miles, empty into the Mississippi 160 miles below the mouth of the Missouri. It descends with a rapid but smooth and transparent current, which is not broken by any considerable falls, except at Louisville. It varies in breadth from 400 to 1400 yards. At Cincinnati it is about 800 yards, which may be regarded as the mean breadth. The floods of this stream rise from thirty to sixty feet above the level of low water. It has sufficient depth at these periods to float a vessel of 300 tons to Cincinnati. This stream has been admired from the period of its discovery, for its beautiful scenery, especially in the first 200 or 300 miles of its course. The gradual slope and luxuriant fertility of its banks, the gentle swells, and deep forests, which are interspersed with cultivated grounds, and rising villages and cities, combine to form a landscape perpetually varying and eminently beautiful.

83. The Ohio receives several considerable branches in its progress. The largest on the north is the Wabash, 500 miles in length; but the principal are the Cumberland and Tennessee, on the south, both of which rise in the Allegany mountains; and, pursuing a circuitous course, enter the Ohio about thirty miles from its mouth. They are both fine streams: the Cumberland about 600, and the Tennessee more than 1000 miles in length. The basin of the Ohio is nearly as large as that of the upper Mississippi, and far more interesting and valuable. It is probable that no portion of the United States contains so

large a proportion of fertile land so well adapted for settlement.

84. The remaining rivers of North America are found almost entirely in the United States; a few emptying into the gulf of Mexico, but most of them descending from the Appalachian chain into the Atlantic Ocean. Of the former, Pearl and Pascagoula are not more than 200 miles in length, and present no features of interest. The Mobile is rather the estuary of two considerable streams, the Tombigbee and Alabama, rising in the mountainous region, bordering on Tennessee, which forms a branch or root of the Appalachian chain. The Apalachicola is a stream of some magnitude. In the peninsula of Florida, the only river of magnitude is the St. Johns; which runs from south to north, nearly parallel to the eastern coast, and sometimes only 100 miles from it. It rises in a swamp or lake, called Lake Mayar, and expanding in its course into several lakes, of which Lake George is the principal, empties into the Atlantic, above St. Augustine, at the distance of 300 miles from its source. The St. Marys, which empties a little above this, is a small stream, only remarkable as the boundary between the State of Georgia and Florida.

85. The Altamaha is the first river of magnitude which belongs to the Appalachian chain on the Atlantic coast. It is formed by two great branches, the Oconee and Oakmulgee, and empties into the Atlantic by several mouths, after an entire course of 500 miles. The Savannah is a smaller stream, whose mouth forms the principal port in this part of the coast. However in the eastern boundary of Georgia, in North and South Carolina, the chief rivers are the Pedee and Santee, which are about the size of the Savannah, or 450 miles in length, and the Cape Fear River which is only 350. Their branches are numerous, and extend over a large part of these states, but present no feature of particular interest. After passing the Cape Fear River, there are no streams of magnitude until we reach the Chesapeake Bay. The James is a noble stream, the principal river and channel of commerce in Virginia. It rises in the interior among the mountains; receives the tide at the distance of 100 miles from its mouth, and empties into the southern extremity of Chesapeake Bay, by a broad estuary, called Hampton Roads, after an entire course of more than 500 miles. The Potomac is the last considerable stream of the Alluvial regions, rising in the Allegany Ridge, and pursuing a winding course of 500 miles, enters the Chesapeake at the middle point of its length. It is the boundary between the states of Virginia and Maryland, through its whole course. At the head of tide waters, 300 miles from its mouth, is the city of Washington, the seat of government of the United States, which is accessible to ships of the largest size. The course of all the streams of the Atlantic alluvion, which have been described, is nearly south-east. The remaining streams of importance run from north to south. The finest in order is the Susquehannah, which empties into the head of the Chesapeake Bay; and indeed may almost be considered as forming this great estuary.

It is a large and beautiful stream, rising by several branches in the state of New York, and pursuing a rapid uninterrupted course through a fertile country extending the whole breadth of Pennsylvania. Its length is about four hundred and fifty miles.

86. The Delaware is a more tranquil silent stream, of about 300 miles in length, and rising not far from the sources of the Susquehannah, it empties by the fine estuary called Delaware Bay, exclusively supplied by its waters. The Delaware forms the boundary between the States of Pennsylvania and New Jersey through its whole course. Its banks are rich and populous; and at the head of ship navigation is Philadelphia, one of the two largest cities of the United States. The Hudson, which is the next in order, is inferior to the Delaware and Susquehannah in length, but more important. It is a broad deep stream, in which the tide flows 160 miles, and seems rather like an arm of the sea than a river. The streams south of this have usually low and level banks, with none but the softer beauties of scenery. The Hudson pursues its course for some distance among the precipitous cliffs and lofty peaks of the Highlands, and along the Catskill mountains, presenting on this part some of the most magnificent and sublime scenery; and in other parts, winding through a rich and level country, which is uniformly more elevated than the banks of the more southern streams. The Hudson rises in the mountainous region between Lake Ontario and Lake Champlain; and, running nearly south into the noble estuary and harbour of New York, is discharged into the Atlantic. Throughout its whole course the banks are lined with large villages and towns, and the city of New York, at its mouth, is not only the most populous in the United States, but is rendered by its situation the great commercial capital of the country; and is gradually becoming the great centre of trade for all the region east of the Appalachian chain, and north of the Ohio. The only considerable branch of the Hudson is the Mohawk, which flows in from the west a little above the head of tide-water. It is precipitated from a bed seventy feet above the level of the Hudson over the falls of the Cohoes. The whole course of these streams is within the state of New York. The valley of the Mohawk is the first passage around the Appalachian chain between the waters of the Atlantic and the upper lakes, and contains the great canal of communication.

87. The Connecticut is the principal stream of the primitive country east of the Hudson, which comprises all the eastern states. It rises on the highlands which bound the valley of the St. Lawrence, a little beyond the forty-fifth degree of north latitude, and pursues a southerly course of 400 miles to Long Island Sound, separating Vermont from New Hampshire, and crossing the states of Massachusetts and Connecticut. The former part of its course presents some bold features, but none of the grandeur belonging to the Hudson. The lower portion flows through a rough uneven country, but is bordered by an alluvial valley of great fertility and exquisite beauty. It is a broad, transparent, rapid stream, generally tranquil, but diversified with a few rapids and

falls; its banks are populous, and thickly set with towns and villages, and connected by numerous bridges. We find only a few small streams, such as the Charles, Taunton, &c., east of the Connecticut, until we reach the coast of New Hampshire and Maine. This rugged country has a number of fine streams of considerable length, but flowing chiefly through a wilderness, and only imperfectly described. The Merrimack belongs to this region, although it empties in the state of Massachusetts. Its course does not exceed 200 miles; and it is chiefly remarkable as having its navigation more improved by art than any other river in North America; and, indeed, as being the first example of this kind upon the continent. The Piscataqua is a small stream only forty miles in length. The Kennebeck is much larger, and more important. The Penobscot is the largest stream of Maine exceeding 250 miles in length; and the St. Croix, or Scoodre River, expands to a considerable breadth near its mouth, but is chiefly interesting as the north-eastern boundary of the United States. The St. John's River is the most important stream of this region, rising in the northern part of Maine, and flowing first to the north-east and east in this state, and then bending to the south, discharges itself in New Brunswick into the Bay of Fundy, after a course of not less than 400 miles, and forming the largest and one of the most navigable streams of the northern section of the coast. The tide flows up eighty miles. The highlands at the head of this stream are a kind of centre of waters, resembling, in miniature, those at the head of the Mississippi. Giving rise on the south-east to this river and the Penobscot, they send off, within twenty miles, the Chaudesere branch of the St. Lawrence to the north; and at no great distance the Connecticut flows to the south, and the St. Francis to the north-west. The heads of these streams, and the direction of the highlands from which they rise, have been recently examined by joint commissioners from Great Britain and the United States, in order to settle the boundary which passes along their summits; and we may therefore hope for a more complete account than we have yet received.

88. We have now reached the boundary which divides the waters we have been describing, from the second great river of North America in the order we have followed, the St. Lawrence, which absorbs all the waters of a tract of country extending from the ocean to the sources of the Mississippi. It is here that we find, in a connected chain, the five principal lakes of North America, whose outlet only has received a distinct name, but which should be considered as one immense stream of various widths, from Lake Superior to the Gulf of St. Lawrence. Viewed in this light, the St. Lawrence exceeds any other river on the globe, as a channel of inland commerce; and surpasses any of the old continent in grandeur. Its length is 2000 miles, and its waters are estimated to cover a surface of 90,000 square miles.

89. Lake Superior, the first important division of the chain, is the largest body of fresh water on the globe; stretching about 350 miles in length, and 100 in mean breadth. Its waters

are drained from other streams of a surrounding basin, probably 60,000 square miles. They cover 35,000 square miles, an extent greater than the whole of Scotland or Ireland ; and its islands exceed in size the lakes which are scattered over the surface of these kingdoms. Isle Royal, the largest, is 100 miles in length, and in some parts 40 in breadth. The waters of Lake Superior are every where of sufficient depth for the navigation of the largest ships. The shores are rocky, and often rise perpendicularly from 300 to 1500 feet in height ; and the principal harbours of safety are found in the islands. The lake is also subject to violent storms, which, with the want of harbour, renders the navigation very dangerous. The soil of the basin is generally so sterile, and the climate so severe, that this extensive sheet of water will probably be of little importance in the promotion of commerce or civilization. It is now only employed as the thoroughfare of the fur trade, which passes by the Grand Portage River on the west, to the sources of the Assinoboin, Red, and other rivers of the northern declivity.

90. Lake Superior is 600 feet below the level of the sources of the Mississippi, and about the same height above the surface of the Atlantic. Its waters issue at the east end in a rapid, interrupted by huge masses of rock, called the Falls of St. Mary. These are an effectual bar to navigation, except for boats and canoes, although the fall is only 23 feet in half a mile. On passing the tracts of St. Mary, we enter the second great division of the basin of the St. Lawrence, comprising Lakes Huron, Michigan, St. Clair, and Erie. The whole surface drained is about 400,000 square miles, of which the lakes occupy 50,000.

91. Lake Huron is next to lake superior, the largest in North America. It resembles that lake in its triangular form, and the purity and depth of its waters. It is about 220 miles long, and 90 in mean breadth, covering about 20,000 square miles, an extent greater than the whole of Switzerland. It is almost divided into two parts by a chain of islands, called by their Indian name of Monatoulin, or Islands of the Evil Spirits, whose residence they were supposed to be.

92. On the west of lake Huron, is lake Michigan, a singular cul de sac appended to this mass of waters, which seems as if it were intended, like the regulating receiver of some hydraulic construction, to receive the occasional surplus and supply the deficiencies of the main stream. It is situated entirely in the territory of the United States, between forty-two and forty-six degrees north latitude. It stretches from north to south in an elliptical form about 300 miles in length, and 50 in average breadth, covering a surface of 15,000 square miles, or half the extent of Ireland. Green bay is a considerable branch on its western side, 120 miles in length, connected with it by a passage, 75 miles in width. Lake Michigan extends nearly parallel to the shores of lake Huron and its outlets, as far south as the latitude of lake Erie, at the distance of less than 200 miles from its nearest point, inclosing the peninsular territory of

Michigan. The communication across the isthmus might easily be completed by a short canal between the rivers of each lake. The straits of Michulmackinare or Mackinaro form the outlet from lake Michigan to lake Huron on the northeast. The strait is navigable for vessels drawing twelve feet of water, and the lake itself for ships any size.

93. Pursuing the direct course of the waters, the river St. Clair conducts us from lake Huron to lake St. Clair, a beautiful but comparatively small sheet of water, about 30 miles in diameter, and 900 square miles in area. The waters are again confined in the channel of the deep broad river of Detroit, which issues from the southern extremity of lake St. Clair, after a course of twenty-seven miles, again expands into the large lake Erie. Lake Erie is the fourth in extent, of the great chain, and forms a beautiful and transparent sheet of water. It has not the great depth of the upper lakes, but still is navigable for sloops of considerable burthen, and was the scene of an important naval engagement during the late war. It is about 230 miles long, 45 broad, and 10,000 square miles in extent. The northern shore is generally high and rocky ; the southern more sundy and shelving. The rocky bottom renders anchorage insecure ; and there are not many harbours in which vessels can take refuge from the violence of its storms. The waters of this lake are discharged at the eastern extremity by the river and falls of Niagara, over a precipice 160 feet high and with rapids above and below the great falls, which render the whole descent to lake Ontario, 450 feet. In consequence of this the discharge of its waters is much increased or diminished by the winds, and there is occasionally considerable change in its level during a long prevalence of wind from the same quarter.

94. Lake Ontario, like Erie and Michigan, has an oval form, but is inferior to both in size. Its length is 180 miles, its breadth about 40, and its contents about 7000 square miles. Its average depth is estimated at eighty fathoms. There are several good harbours, and it is the channel of valuable commerce ; but its navigation is liable to much danger from the storms which prevail over the whole of this chain of inland waters. At the eastern end of lake Ontario it empties itself by numberless passages through a group of islands termed the Thousand Isles, into the channel of the St. Lawrence, and, with some inconsiderable expansions, the form and current of a river is preserved to the ocean.—After passing the island of Montreal, the St. Lawrence receives the waters of two other connected lakes, lake Champlain, and lake George, which are situated within the United States. Lake George is the source of these waters ; a small but interesting lake, remarkable for the purity of its water, and the beauty of its islands and scenery. It flows with a rapid current into Lake Champlain, which extends 160 miles in length, and one to sixteen miles in breadth. Its shores are generally bold and rocky, and often precipitous ; and its scenery, especially on the eastern shore, is often very fine. These lakes form the principal passage between the United States and Canada, and have been at different

periods of the history of North America, the scenes of sanguinary battles, and naval engagements.

95. Several smaller lakes are connected with the great chain which has been described. Some of the most interesting are the small lakes of the state of New York, emptying into Lake Ontario. Cayingo lake, the largest, is forty miles long, and twelve broad, about the same extent with the lakes of Constance and Geneva, in Switzerland. It is here interesting to notice also, that Lake Ontario, the smallest of the great chain, except St. Clair, is larger than any body of fresh water yet discovered on the eastern Continent. Lake Nepining, which empties into lake Huron, is the most considerable on the north of the great chain, being about equal to lake St. Clair in extent.

96. The river St. Lawrence, which forms the outlet of this vast mass of waters, after a course of 400 miles from lake Ontario, forms an estuary called the gulf of St. Lawrence of about the same length, and 250 miles in breadth, which is separated from the ocean by the island of Newfoundland, and communicates with it by two openings between the island and the main. The quantity of water which flows through this channel to the ocean, after all the waste of evaporation, may be estimated by the dimension of the channel below the falls of Nyagara. The river is here half a mile broad, twenty-five feet in average depth, and flows about three miles an hour. In one hour, therefore, it discharges a column of water, which would fill the channel for three miles, or 1,111,000,000 cubic feet; being 8,000,000 cubic feet, or 113,000,000 gallons each minute.

97. On the northern declivity of North America we find rivers of a similar character to the St. Lawrence, but inferior in magnitude, including several lakes in their course. The most remarkable is Mackenzie's river, which is called the Unyah or peace river at its source. It passes through lake Athapescow, and assumes the name of Place river; expands into the Slave lake, and from the northern extremity of this lake pursues its course to the Arctic ocean, under the name of Mackenzie's river; the whole length of this stream exceeds 2000 miles. The Athapescow lake which discharges its waters through the same outlet, is also supplied by the Athapescow or Elk river, which rises not far from Peace river. Slave lake lies between latitude 60° and 62° north. It is twenty-seven miles in length from east to west, and about forty in average breadth, and equal to lakes Michigan and Eric in size.

98. The Sascatchawine river rises in the Chipewyan mountains, and passing through lake Winnipee, empties by Nelson's river into Hudson's Bay. A number of other lakes are connected with these waters, and with each other, by a variety of inoculations which indicate the level character of the country. The water course which rises near lake Superior in the Long lake, and lake of the Woods, also passes through lake Winnipic, and finds its way by a different outlet to Hudson's Bay.

99. Lake Winnipic appears to be the largest of the northern lakes, and Slave lake is next in

size; both are less than lake Huron, and approach to lake Erie in extent. The Athapescow lake is among the largest of the others. The lake of the Woods which forms a part of the boundary of the United States, is among the small lakes of this continent, but is larger than those of Switzerland. The nature of the country, and the climate, will probably prevent the employment of these extensive water courses in commerce, except in the portage of cannon, for the conveyance of the hunters and their provisions, and furs, and the few articles which the natives are able to purchase.

100. In the southern peninsulas portion of North America, the largest lake is Nicaragua, about 200 miles in circumference. It is of such depth as to be navigable for the largest vessels. It communicates with Lake Leon, and its waters empty into the Caribbean Sea, by the River St. Juan: it is only twenty or thirty miles from the Pacific Ocean. The valley, in which is the city of Mexico, contains five lakes, of which Tetrica, which formerly flowed around the capital, is the largest. It is eighty square miles in extent, and is only remarkable on account of its situation, and saltiness. All these lakes communicate with each other, and the superfluous water of ~~the~~ ³⁴ valley is discharged by the river Tula, at the harbour of Sampico. Lake Chapala, which lies west of these, is the largest in Mexico, thirty miles in length, and twenty in width. It communicates with the river St. Jago, which empties into the Pacific Ocean.

101. The only large river of the western declivity which has been fully described is the Columbia, which rises in the Chippewan Mountains. It has three principal branches, Clark's River, Lewis's River, and the Multnomah; the most northern of which rises near the sources of the Missouri, while the main stream rises near the head waters of Mackenzie's River: it empties into the Pacific, in the forty-sixth degree of north latitude, after a course of 1500 miles. The stream is remarkably large in proportion to its length. At the junction of Lewis's River, 400 miles from the sea, it is 960 yards wide, and below the head of tide-water, 159 miles from its mouth, it expands to four or five miles, and is capable of receiving vessels of considerable burthen. The greater part of its basin is considerably elevated above the ocean, and it is, therefore, precipitated over a series of ledges which obstruct its navigation, but add to the beauty of the scenery: the banks are generally productive, and the appearance of the country interesting. The Colorada, the principal remaining river of the western declivity, rises in the Mexican Cordillera, or Sierra Madre, and empties into the gulf of California after a course of 1000 miles. It has been too imperfectly examined to permit any correct description. On passing to the western side of the mountains, we find the Rio del Norte, which rises near the sources of the Arkansaw, about 300 miles north-west of Santa Fe. It is peculiarly an independent river, and pursues a course of 1500 to 2000 miles to the gulf of Mexico almost without receiving a single branch. The stream can be forded with great difficulty during the summer; but it is subject, like other

rivers of this region, to annual floods, which continue two or three months, and raise it far above the ordinary level. Its waters are remarkably turbid. The Colorado of Texas is the only considerable river before reaching the Sabine, which forms the western boundary of the United States for 250 miles from the gulf of Mexico to its source, and empties only a short distance from the mouth of the Mississippi.

102. **INLAND NAVIGATION.**—North America is penetrated by four great rivers, the Mississippi, the St. Lawrence, the Columbia and Mackenzie's River, by which navigation is extended to a great distance into the interior. The Mississippi and its branches, drain the great central basin which lies between the Allegany and Chippewian Mountains. On the Mississippi, the navigation for boats of considerable burthen extends to the Falls of St. Anthony. On the Missouri, which is the largest, and in fact the principal stream, it extends to the Gates of the Rocky Mountains. From the secondary character of the country, the numerous branches of these great rivers are generally navigable, and afford a passage from almost every part of the western states, and the vast regions at the base of the Rocky Mountains, to the Gulf of Mexico and the ocean, at least during the season of high water, from the spring to the middle of summer. The current of the principal streams is so rapid, that although their depth would admit vessels of considerable size, the navigation is chiefly by means of steam-boats. Even the ascent from the mouth of the Mississippi to New Orleans is so difficult that vessels are sometimes delayed thirty days.

103. The navigation of the Mississippi is attended with some danger, from the numerous trees fixed in its bed, which are called by the boatmen planters and sawyers, and are as fatal to the boats as reefs of rocks. Below Natchez these dangers are obviated by the depth of the water. Above this they become more and more numerous and difficult to pass; but the main channel, though intricate, affords depth of water in all stages sufficient for boats of five or six feet draft, to the mouth of the Ohio. From this point to the mouth of the Missouri, 220 miles, the navigation is obstructed by shoals at low water, which will not admit boats drawing more than three feet. Its current probably averages $3\frac{1}{2}$ miles an hour. The obstructions to the navigation of the Missouri resemble those in Mississippi but are much greater. This stream is rapid and turbulent. No part of it is exempt from rafts, bars, snags, or other obstructions, and the channel is very intricate. From March to July or August, it is raised by freshets to such a height as to admit boats of any burden; but during the remainder of the year, it can scarcely be called navigable, except for boats drawing two to two and a half feet of water. Its velocity in a middle stage of water is four miles and a half; in freshets five and a half per hour. It is usually blocked up with ice during the winter.

104. The Ohio is navigable for boats of considerable burthen, from the middle of February to the latter part of June, and again a few weeks during the freshet in the autumn. The falls of Louisville can be passed by large boats, only in

the highest water. During low water, boats of small burden cannot pass some other rapids and shoals, and the river is fordable in many places.

105. The Arkansaw is the next branch to the Missouri in size. It has only short periods of flood, and will not admit boats of considerable burthen. A part of its channel is sometimes dry. The Canadian, a branch of the Arkansaw, 1000 miles in length, leaves its channel dry a large part of the summer. The Red River is navigable most of the year to the Great Raft, a collection of timber which closes the passage, 500 miles from its mouth. The river St. Francis is blocked up at its mouth by rafts of logs and drift wood, which prevent the passage of boats entirely.

106. The branches of the Missouri are usually blocked up at their mouths after the freshets in July, until the next spring, with mud brought down by the Missouri. They are of course navigable only during the freshets. The Platte is a broad shallow stream, fordable in almost every part, and navigable only for canoes of skins.—The Yellowstone is nearly as large as the branch which takes the name of the Missouri, and is navigable through the greater part of its course.

107. The St. Lawrence is navigable nearly to Montreal, for vessels of 600 tons burthen, where it is obstructed by rapids. The boat navigation continues above them to Ogdensburg, whence sloops and large vessels may be navigated 170 miles, through Lake Ontario, to the River Niagara. At the falls is a portage of seven miles, after which there is a navigation of 231 miles through Lake Erie, for vessels of sixty or seventy tons. The navigation continues by the straits of Detroit twenty-eight miles; Lake St. Clair twenty miles; and the River St. Clair sixty miles, to Lakes Huron and Lake Michigan. Between Lakes Huron and Superior, are the rapids of St. Mary's Straits; along a part of which a canal has been formed by the British North West Fur Company, for the convenience of their traders.

108. The River St. Lawrence above Quebec, and a great part of the lakes are frozen over from the beginning of December till April; but an easy and rapid conveyance is afforded over the ice by means of sledges. The common route of the fur traders in their bark canoes, is from the Saint Lawrence, through the Ottawa or Grand River, and thence by a short passage to Lake Nipissing, and down the French River, into Lake Huron. This route is one-third shorter than through the great lake. From Lake Huron they proceed through the straits of Saint Mary, and Lake Superior, to the Grand Portage, nine miles in length, which brings them to the great northern chain of Lakes, beginning with the lake of the Woods, at the distance of 1100 miles, from the place of their departure.

109. Lake Champlain is a branch of the Saint Lawrence, emptying into it by the River Sorel, or Richelieu. Vessels of 150 tons may ascend twelve or fourteen miles; and boats to Clambly or St. John's. From this place there is a ship navigation of 160 miles on the lake, to the shores of Vermont and New York. The River St. Francis, one of whose branches rises in Lake St. Francis, and another in Lake Memphrem-

gog, is also a channel of navigation to the St. Lawrence.

110. The Columbia River is from one to three miles wide in the lower part of its course. Vessels of 300 tons may ascend to the mouth of the Multomah, 125 miles; and sloops, to the head of the tide waters, sixty miles further. At the distance of 200 miles from the mouth, there are two rapids which require a short portage; but except these, the boat navigation is uninterrupted as far as the great falls, 260 miles from the sea. The numerous rivers on the eastern declivity of the Apalachian Chain, afford the advantages of a good inland navigation to most parts of the Atlantic states. In all those streams which flow through the alluvial region, from the Mississippi to the Roanoke, the tide waters of the ocean terminate at some distance from the foot of the mountains, varying from 30 to 120 miles. From the Roanoke to the floods, they extend through the alluvial region to the base of the primitive hills; but in no rivers south of the Hudson do they pass beyond the alluvial region. As far as the tide flows the streams are generally navigable for sloops.

111. In passing from the hilly and primitive, to the flat and alluvial region, the streams are almost uniformly precipitated over ledges of rocks, by rapids which obstruct their navigation. Indeed the line of alluvion marks the line of navigation from the sea, which passes through Milledgeville on the Altamaha, Augusta on the Savannah, Columbia and Camden on the Santee, Richmond on the James, Fredericksburg on the Rappahannock, Georgetown on the Potomac, and Trenton on the Delaware. Above the rapids, navigation is performed entirely by boats propelled by oars or poles, or drawn up by ropes, or by means of the bushes growing on their banks.

112. The Savannah River is navigable for ships to Savannah, and for boats 350 miles to Augusta. The rivers of South Carolina are navigable nearly through the alluvial region, and there are some good harbours at their mouths; that of Charleston, which is formed by the Ashley and Cooper Rivers and the Santee Canal, with the Santee River.

113. The coast of North Carolina is lined with a range of low, sandy islands, enclosing a chain of sounds. Their entrances are generally obstructed by bars, and no vessels of considerable size can enter. But the streams are navigable for sloops, some distance into the interior.

114. The Chesapeake bay is of itself an inland sea of considerable size; and, with the numerous streams and inlets on its borders, forms an important channel to the ocean, for a large extent of country, covering the whole of Maryland and the eastern declivity of Virginia; and extending through the middle section of Pennsylvania, nearly to the small lakes of New York. The largest ships have access to its shores, and proceed to some distance, in several of its streams. Not far from the entrance of the bay are Hampton Roads, which is the first anchoring ground for vessels from the ocean. The James river is navigable for large ships to James town, and for sloops to Richmond. Canals are formed around

the falls at this place, and several obstructions above, which extend the boat navigation 227 miles above Richmond. The Potomac is navigable for ships of any burden to the navy yard at Washington; and this is the most inland point in the United States, to which the largest vessels have access. Above Washington, there are five falls on this stream, which are rendered passable by canals. A boat navigation is thus opened to its sources, which are connected with the waters of the Mississippi by the great Cumberland road. The Susquehannah is obstructed at its entrance into Chesapeake bay by a series of rapids, extending forty miles, to Columbia, which can scarcely be ascended by boats. Attempts have been made to remove these obstructions, at great expense; and a canal of one mile in length has been cut around the Conewago falls, twenty miles above Columbia. But the navigation of this river is still so difficult, that the trade is principally confined to the conveyance of timber in rafts, and of produce in large flat boats, termed arks, from the interior to the bay. Above the falls of Conewago, there are few obstructions in the Susquehannah to the boundaries of New York; and batteaux may ascend to its very sources.

115. The Delaware bay and river are navigable for the ^{largest}³⁴ ships as far as Philadelphia; but the ascent is often much retarded by the current. Sloops ascend to the falls at Trenton; and boats of eight or ten tons, 100 miles farther, to Easton. By means of the Schuylkill and Lehigh, it affords inland navigation to a long though narrow section of country, comprising the eastern part of Pennsylvania, and the western part of New Jersey. A canal is now forming to connect the Schuylkill with the Susquehannah, and thus open a direct navigation from the basin of the Susquehannah to Philadelphia and the ocean. The Lehigh, one of its branches, has been rendered navigable for a part of its course, to open a conveyance from the extensive beds of coal upon its banks.

116. The Raritan river, in the northern part of New Jersey, is navigable for sloops to Brunswick, within twenty-eight miles of the head of sloop navigation on the Delaware; and the Passaic and the Hackensack afford a short inland navigation. But the dry sandy region of New Jersey on the south, and the mountainous portion on the north, have no navigation except from their borders; and there are few harbours on the eastern coast.

117. The Hudson is the only river in the United States where the tide passes through the alluvial, primitive, and transition formations. It is navigable for ships to the city of Hudson, and sloops of considerable burden pass through all the formations, to the falls of the secondary country, above Troy, which is 165 miles from the ocean. This is the most distant point to which the tides flow, and sea-vessels can approach in a direct line, in the United States. At its mouth this river forms the harbour of New York, which is considered one of the finest in the world. The Northern Canal connects the Hudson with the borders of Lake Champlain and the St. Lawrence; and the Western Canal with the

upper lakes, and the rich secondary region which occupies the centre of the state. This river is thus made the grand artery of an inland navigation, by which the wealth of this tract of country will flow to the city of New York.

118. In the rivers of the United States, east of the Hudson, the tide extends only a small distance, and the navigation is obstructed by the falls and rapids which are common in primitive countries. The Connecticut river is navigable for vessels of considerable size, fifty miles to Hartford. Several canals and locks have been constructed on this river at South Hadley, Hanover, and some intermediate rapids, which extend the boat navigation to Averhill, in New Hampshire. In the eastern part of Connecticut, the Thames is navigable for sloops to Norwich, and forms the fine harbour of New London, at its mouth. Narraganset Bay, and the streams which empty into it, afford easy access from the ocean to every district of Rhode Island. A canal is contemplated, to extend from Providence into the interior of Massachusetts, to furnish an easy conveyance for fuel and produce to this flourishing seaport.

119. The Merrimac of New Hampshire, is much obstructed by rapids; but its upper waters are connected with Boston Harbour by the Middlesex canal. The rivers of Maine are generally obstructed. The Penobscot, the St. Johns, and the western branch of the Kennebec, afford a boat navigation nearly to their sources. The heads of these rivers approach within no great distance of the waters of the St. Lawrence; and the portage from the head of the Kennebec to that of the Chaudiere River is only five miles. The basins of the river St. Lawrence, and the Mississippi, and the Atlantic declivity are so intimately connected, that it would not be difficult to unite them by an inland navigation; and much progress has been made in accomplishing this important object. The waters of the St. Lawrence, or the great lakes, have two natural communications with the branches of the Mississippi at particular seasons. The Fox river, which flows into the branch of Lake Michigan, called Green Bay, rises near the Ouisconsin branch of the Mississippi, and afterwards flows within a mile and half of its channel, separated from it only by a short portage, over a prairie. During the season of high water, this river is easily navigable, and the intervening ground is overflowed, so that loaded boats may pass to the Ouisconsin, which affords a rapid but unobstructed navigation to the Mississippi. A short canal would render the communication permanent.

120. Another communication is stated to exist from the Chicago River, emptying into the southwestern corner of Lake Michigan, to the Illinois. It is passed by boats of fifty tons, engaged in the fur trade, and is open at all seasons, except about three months. The Atlantic waters are united with Lake Ontario, and the lower portion of the St. Lawrence, by the Northern Canal of New York, from Whitehall, on Lake Champlain, to Fort Edward, on the Hudson. It passes in part through the channels of small streams; and the navigation is extended around the ob-

structions in the Hudson River, to Albany; it is the channel of considerable trade.

121. The most important canal in the United States, and the longest in the world, except the Imperial Canal of China, is the Grand Western Canal of New York. It passes from the Hudson River along the Mohawk, generally above its level, to Rome; and thence westward, across the head of the small lakes, and over the Genessee River, to lake Erie, at Buffalo, connecting the Atlantic with the great Anticasa above the falls of Niagara; in different parts, it rises about 526 feet, and contains in the whole, about eighty locks, with several considerable embankments and aqueducts. It was commenced in 1817, and in 1823 it was finished from Albany to Rochester. It is expected that the whole canal will be completed in 1826. The expense is estimated at about five millions of dollars. The canal will be the property of the state; and is likely to afford an immense revenue for public purposes. Since the commencement of this great work, an effort has been made by the people of Canada, to prevent the diversion of trade from Montreal, by cutting a canal along the northern shore of the falls of Niagara, and thus complete the chain of communication by the lakes. It is said that the project is ready for execution; and many of the preparations made for commencing the work.

122. Two routes have been proposed to connect the Atlantic and western waters, by means of the Grand canal of New York. The most obvious is by a Canal from lake Erie to the branches of the Ohio, which will probably soon be overtaken by the state of Ohio. The other route is by a canal from lake Erie to lake Michigan, and another from Chicago river to the Illinois. The latter route is but little longer than the former; and the navigation would probably be less obstructed. It is also proposed to connect the Ohio with the Atlantic, by a canal from the head waters of the Monongahela to those of the Potomac, which will pass under the principal ridge of the Allegany, by a tunnel two miles in length. There is now a portage communication, by means of the Cumberland Road. The state of Virginia proposes another portage communication, from the head waters of the James to those of the Great Kanawha; and a third has been proposed in Pennsylvania, from the western branch of the Susquehannah to the Allegany river, and also to lake Erie.

123. Great facilities also exist for the establishment of an inland navigation along the coast of the United States, from New Hampshire to Georgia. The Middlesex canal connects the Merrimac river above the falls, and the interior of New Hampshire, with the harbour of Boston. From this harbour and Massachusetts bay, a canal across the isthmus which unites cape Cod to the main, would form a communication through Narraganset bay, and Long Island Sound, to New-York. The Raritan river could be connected with the Delaware by a canal of twenty-eight miles, requiring only an elevation of thirty feet to the summit level. The Delaware bay will soon be united with the Ches-

peak by another, of twenty-two miles, between Christiana and Elk river, which is commenced. All these canals would pass through a flat country; and might be constructed without very great labour. It is somewhat doubtful, however, whether the canal across the isthmus of Cape Cod would not be liable to obstructions, by the accumulation of sand; and another route has been thought more likely to be useful, connecting Boston Harbour with Taunton River, which empties into Narraganset Bay, by a canal twenty-six miles in length, rising 133 feet. After descending the Chesapeake Bay to Norfolk, on the Elizabeth River, there is a canal passing through the Great Dismal Swamp, which extends

the navigation to Albemarle Sound. From this sound, a range of low islands extends along the coast to Florida, which forms an inland passage nearly the whole distance. A part of this distance may be traversed by the canal which connects the Santee River with the harbour of Charleston.

124. The following table shows the size and extent of the canals of the United States, in comparison with the principal works of the same kind on the eastern continent, from which it appears that the Grand Canal exceeds all works of the kind in length, except the Imperial Canal of China, which passes, for a considerable part of its course, through the channels of rivers.

Canals.	Connecting.	Long.	Broad.	Deep.	Elevation.		Locks.
					Miles.	Feet.	
Imperial, Chinese	Pekin and Canton . . .	500	—	—	—	—	—
Western, New York	Hudson and Erie . . .	360	40	4	526	80

Champlain	Champlain and Hudson .	22	40	4	140	42	
Chesapeake	Chesapeake and Delaware .	22	—	—	—	—	

125. The extensive channels of navigation which we have described are fully estimated, and diligently employed, by the Americans. The Mississippi and Ohio are continually traversed by 50 to 100 steam boats of very large size. They are found in great numbers on the rivers of the Atlantic states; and the chain of communication along the coast is almost completed by the union of these with regular conveyances across the short portages. They are also found upon the great lakes, furnishing regular conveyance along this immense channel of navigation. The great canals of communication from the Atlantic to the northern and western waters are crowded with boats, and yield a revenue which exceeds all previous calculation. In short, the country is capable of an internal commerce, whose importance is only beginning to be developed.

126. The table-land of Mexico, as has been already remarked, is too dry to permit internal navigation, except for very short distances. The Rio del Norte, although a stream of considerable size, is so interrupted by sand bars in the low country, and rapids above, that it is not navigable except for short distances. The other rivers, and the adjoining country are too little known to admit of description, except a few short streams which descend from the table-land, and are in connexion with the coast. Mackenzie's river, and other streams of the northern declivity permit an extensive navigation by canoes, with some interruption by rapids; and the na-

ture of the country renders it a question of little interest, whether any other navigation is practicable.

127. The most interesting topic connected with the inland navigation of the peninsular portion of North America, is, the possibility of establishing a water communication between the Atlantic and Pacific Ocean. Their close approximation, and the immense advantages which would result to commerce, by shortening the distance to the East Indies, has made this a constant subject of discussion; but still the common intercourse between the places on the coasts, and the table-land, is carried on entirely by mules, over the immense heights of the table-land, or by long and difficult portages. Nine points have been suggested in different parts of the continent for the object.

128. In the northern and widest portion of the continent, the sources of several great rivers approach very near, and we have reason to suppose that the Columbia rises not far from the head waters of the Missouri, Nelson's river, and Mackenzie's river. This route would be only important on account of the fur trade, which would be secured to the nation that should complete and control such a communication. 2. In latitude 40°, the sources of the Rio del Norte are separated from those of the Colorado, by a mountainous tract of only twelve or thirteen leagues in breadth, but presenting too circuitous a route, and too great an ascent, to furnish an

useful communication. 3. The isthmus of Tehuantepée offers the first eligible spot, and perhaps the most advantageous of all. The river Thiarualeo, which empties into the gulf of Mexico, has a branch called the Rio del Passo, which rises in the central highlands at the distance of only six leagues from the head of the Chimalpa river, which empties into the Pacific at Tehuantepée. It is said by one of the engineers, who was employed to survey the ground, that the central ridge was crossed by transverse valleys, and that a canal might be cut from one stream to another, without deviating from a level or employing a single lock. If this be the case, the only remaining difficulties are to remove some obstructions in the upper part of the Passo, and to deepen the harbour of Tehuantepée, which has been for a century past neglected and filling up with sand. This was at one period the principal rout between the oceans. It is stated, in a recent official report to the Mexican congress, that in 1814 the Cortes of Spain decreed the opening of the canal at this point, and committed the execution of the plan to the local authorities. Their inability to attempt so great a work, and the subsequent war of independence, entirely prevented even the preparation for it. But since the establishment of the new government, this ^{cons} states, that application has been made by foreigners for permission to execute it, which offers much hope of its completion. 4. The Lake of Nicaragua communicates with the Caribbean sea, by the river St. Juan, and is separated by a narrow isthmus from the Gulf of Papagayo. Several volcanic summits are found in the interval, but the nature of the country is little known; the distance does not exceed twenty or thirty miles, and it is even a matter of doubt, whether any chain of mountains exists here; but we have no accounts more recent than the voyage of Dampier, which speaks of it as only a little hilly, and for the greatest part level. The most serious obstacle to the utility of this, will probably be found in the dangerous storms which rage upon the coast during several months in the year, and extend also to Tehuantepée.

129. The Isthmus of Panama has been the spot generally selected for a canal, as being the narrowest part of the continent. The River Chagres, which empties into the Caribbean Sea, to the west of Porto Bello, affords good navigation to Cruces, and obstructs it only by the rapidity of its current. This point is attained in four or five days in ordinary times; and a journey of five leagues only remains to the port of Panama. This was for a long time the only route for transportation from Peru and Chili to the Atlantic, and is still much used in time of war; but the passage round Cape Horn is now preferred in time of peace. With regard to the construction of a ship canal across the Isthmus, Humboldt ex-

presses his decided opinion that it ought to be abandoned; that no passage can be opened which would admit any thing larger than flat boats, which might transport merchandize from sea to sea; and, as the passage would be entirely under the control of the owners of the country, there would still be difficulties in this channel of commerce, which would lead the greater number of merchants to send their vessels round Cape Horn. Its principal value would be in reference to the commerce of the western coast of South America, and would be very great in time of war. The thin population of this region, and the indolence and ignorance of the inhabitants, almost precludes the possibility of effecting so great an object by the labour of the natives; and the pestilential character of the climate would probably render it impracticable to accomplish by the aid of foreigners. The country must be materially improved, from its present neglected unproductive condition, before it could support the necessary labourers and animals; and, when these objects were effected, the great number of foreigners who perish in the mere passage across the isthmus, or in the intervals before embarkation, indicate the danger there would be in making it the commercial route between the oceans.—With regard to the whole extent of the labour requisite either here or at any other point of the isthmus, we are quite ignorant. From the republic of Columbia to the environs of Mexico there is not a single mountain, or city, or station whose elevation is known; and even the longitude and relative positions of Panama and Porto Bello, have never been accurately ascertained.

130. Should any effort of art, or convulsion of nature, open an entire passage from sea to sea, great changes must follow on the coast of the Atlantic. The ocean is probably elevated twenty feet above the level of the Pacific; of course the extent of the land would be increased, and the shores be extended; sea-ports would be removed inland; many shoals and rocks would become dry, and new ones probably arise. The waters of the Gulf-stream would doubtless be diverted into the new opening, and the effects would thus extend along the whole coast of North America, and effect great changes in the relative situation and commercial relations of its harbours and sea-ports. The desecration of low grounds by the tides would probably produce pestilential diseases in many instances; and a generation might pass before the effects of this great revolution would be fully developed. Its effects on the state of the world are more difficult to estimate. We can only say, that the greatest obstacles to the invaluable trade of Western America and the East Indies would be removed, and the bulwark of the independence of China and Japan would be broken down.

which arsenic has been united, are gold, silver, tin, lead, nickel, zinc, antimony, and bismuth; it also forms an amalgam with mercury, by keeping them some hours over the fire, constantly agitating the mixture. Arsenic is capable of combining with two different proportions of oxygen; by the first is formed the white oxide already described, or arsenious acid, as it is denominated by Fourcroy, on account of the many acid properties which it exhibits; by the second is produced arsenic or arsenical acid, which was discovered in 1775 by Scheele, who also made himself acquainted with its most remarkable properties.

In pharmacy, the white oxide of arsenic is directed by the London Pharmacopœia to be sublimed; after which it is to be boiled with an equal weight of carbonate of potash, in order to form the liquor arsenicalis, sometimes called Fowler's solution, or the tastelessague drop. This contains one grain of arsenic in two drams, is given in doses of a few drops in intermittent fevers, and in several eruptive diseases. Caution is necessary in the exhibition of so dangerous a remedy. Arsenic has been used externally in cancer, lupus, &c. in form of an ointment. For an account of arsenic, as a poison, its symptoms, effects, and remedies, see POISON.

ARSENICAL MAGNET, MAGNES ARSENICALIS, is a preparation of antimony, with sulphur and white arsenic.

ARSENIUS, a deacon of the Roman church of great learning and piety, who was selected by the pope as tutor to Arcadius, son of the emperor Theodosius. Arsenius arrived at Constantinople A.D. 383. The emperor happening one day to go into the room where Arsenius was instructing his pupil, found Arcadius seated and his preceptor standing; at this he was exceedingly displeased, took from his son the imperial ornaments, made Arsenius sit in his place, and ordered Arcadius for the future to receive his lessons standing uncovered. Arcadius, however, profited but little by his tutor's instructions, for some time after he formed a design of despatching him. Arsenius, however, being of the design, retired to the deserts of Scæcia, where he passed many years in devotion, and died aged ninety-five.

ARSENIUS, bishop of Constantinople, in the thirteenth century, excommunicated Michael Palaeologus, for taking the imperial crown from John Tzachis the son of Theodore. Though Michael solicited absolution, the bishop refused, unless he would restore the crown; in consequence of which Arsenius was banished to a small island, where he died.

ARSENOTHELYS, among ancient naturalists, the same with hermaphrodite. The Greeks use the word both in speaking of men and beasts. It is derived from *αρσην* and *θηλυς*, male and female.

ARSEMVAL, in geography, a town of France, in the department of the Aube, and chief place of a district in the district of Bar-sur-Aube, twenty-three miles east of Troyes.

ARSES, or ARSAMES, king of Persia, succeeded Artaxerxes Ochus about A.M. 3612, and after a short reign of less than four years was slain

by Bagoat, who had murdered his predecessor, and succeeded by Darius Codomanus.

ARSHIN, in commerce, the most common Russian measure of length, = 16 vershok, = 315 $\frac{1}{2}$ Paris lines. It is also a Chinese measure, but one Chinese arshin = 302 Paris lines. Three arshins = 1 fathom, and 500 fathoms = 1 verst.

ARSIA, in ancient geography, a small river which had a northerly course, and served as a boundary between Histria and Illyria, to the north of the Flanatic gulf. It there terminated Italy on the north-east of the Polatic promontory.

ARSINOE, in ancient geography, the name of various towns mentioned by Strabo, Ptolemy, Stephanus, &c. viz. of five towns in Cilicia, one of which had a station for ships; of three in or near Cyprus; viz. one inland, formerly called Marium, another north of it between Acamas and Soli, and the third in the south, with a port, between Citrum and Salamis. A sea-port in Cyrene, formerly called Teuchira. A town in Egypt near the west extremity of the Arabian Gulf, and south of Hierapolis, called also Cleopatra. Another in the Nomos Arsinoites, mentioned on some coins of Adrian, and formerly called Crocodilorum Urbs, from its abounding with crocodiles; Ptolemy calls this town an inland metropolis, with a port called Ptolemais. A sea-port of Lycia formerly named Patara, but called Arsinoe by Ptolemy Philadelphus after his queen. And three towns of Trogodyta, the chief of which was situated near the mouth of the Arabian gulf, which towards Ethiopia is terminated by a promontory called Dire. This Arsinoe is called Berenice, with the distinction Epidires; because situated on a neck of land running out a great way into the sea. Also the name of several princesses of Egypt; particularly, 1. the daughter of Ptolemy Lagus, and wife of Lysimachus king of Thrace: 2. the wife of Ptolemy Philadelphus, who named several towns after her.

ARSINOR, in entomology, a species of papilio, found in the island of Amboyna, the wings of which are tailed, indented, fulvous, spotted with black; and the posterior ones marked both above and beneath with two ocellated spots. It is figured by Seba and Cramer.

ARSINOITES, Nomos, an ancient district of Egypt, west of the Heracleotes, on the western banks of the Nile.

ARSIS, and **THESSIS**, in prosody, are names given to two proportional parts into which every foot or rhythm is divided. By arsis and thesis are usually meant no more than a proportional division of the metrical feet, made by the hand or foot of him that beats the time. And in measuring the quantities of words the hand is elevated, as well as let fall; that part of the time which is taken up in measuring the foot, by lifting the hand up, is termed arsis or elevatio; and the part where the hand is let fall, thesis or positio. Vid. Augustin de Musica, lib. ii. cap. 10. In plaudendo enim quia elevatur et ponitur manus, partem pedis, sibi elevatio vendicat, partem positio.

Arsis and thesis are used as musical terms

A R T.

when the subject of a fugue or point is inverted or reversed; i. e. when one part rises and the other falls. These two words are Greek: *arsis* comes from *ἀρπω*, tollo; I raise or elevate; *θετος* depositio, remissio, a depression or lowering. These terms were applied by the ancients to the motion of the hand in beating time.

ARSON, in English law, is the malicious and wilful burning of the house or out-house of another man, which is felony. This is an offence of great malignity, and more pernicious to the public than simple theft; because, first, it is an offence against that right of habitation which is acquired by the law of nature as well as by the laws of society; next, because of the terror and confusion that necessarily attends it; and, lastly, because in simple theft the thing stolen only changes its master, but still remains *in esse* for the benefit of the public; whereas by burning, the very substance is absolutely destroyed.—It is also frequently more destructive than murder itself, of which too it is often the cause; since murder, atrocious as it is, seldom extends beyond the felonious act designed; whereas fire too frequently involves in the common calamity persons unknown to the incendiary, and not intended to be hurt by him, and friends as well as enemies. If the house be a man's ~~house~~ the act is not felony and punishable with death, but only a great misdemeanor, and punishable by fine, imprisonment or pillory.

ARSUR, Asor, ArsaF, or ArSiD, a hamlet on the coast of Syria, which has sometimes received the name of a city, because Solomon is supposed to have built the city Asor upon the site. It contains a fortress and mosque, in the last of which are a few Mahomedan monks.

ARSURA, in ancient customs, a term used for the melting of gold or silver, either to refine them or to examine their value. The method of doing this is explained at large in the Black Book of the Exchequer, ascribed to Gervaise in the chapter *De Officio Militis Argentarii*, being in those days of great use, on account of the various places and different manners in which the king's money was paid. Arsura is also used for the loss or diminution of the metal in the trial. In this sense a pound was said, tot ardere denarios, to lose many penny-weights.

ARSURA, in medicine, is used by some writers for the erysipelas.

ARSURA, in metallurgy, is used for the dust and sweepings of silversmiths, and others who work in silver, melted down, and which they call their sweep.

ART,
AR'TFUL,
AR'FULLY,
AR'FULNESS,
AR'TISAN,
AR'TIST,
ARTLESS,
ARTLESSLY,
AR'TIFICE,
AR'TIFICER,
AR'TICIAL,
ART'ICALLY.

Lat. *ars*, from *ἀρπη*, manly energy, strength, or skill. The power of doing any thing arising from a clear and perspicuous knowledge of what the practice of it requires. Artful signifies evil intention. One who exercises a mechanical art is an artisan, he who excels in the fine arts is an artist. Any skilful workman is an artificer; artifice in its present use implies deception.

HEL. We, Hermia, like two *artificial gods*,
Created with our needles both one flower,
Both on one sampler, sitting on one cushion;
Both warbling of one song, both in one key;
As if our hand, our sides, voices, and minds,
Had been incorporate. *Shakespeare.*

Why, I can smile, and murder while I smile;
And cry, content, to that which grieves my heart;
And wet my cheeks, with *artificial tears*. *Id.*

Weaker than a woman's tear,
Tamer than sleep, fonder than ignorance,
And *artless* as unpractis'd infancy.

Dryden. *Troilus and Cressida.*
Rich with the spoils of many a conquer'd land,
All arts and *artists* Theseus could command,
Who sold for hire, or wrought for better fame
The master painters and the carvers came. *Dryden.*

The rest in rank: Honoria, chief in place
Was *artfully* contriv'd to set her face,
To front the thicket, and behold the chace. *Id.*

Vice is the natural growth of our corruption. How irresistibly must it prevail, when the seeds of it are artfully sown, and industriously cultivated. *Rogers.*

What are the most judicious *artisans*, but the mimics of nature? *Wotton's Architecture.*

Best and happiest *artisan*,
Best of painters, if you can,
With your many-color'd art,
Draw the mistress of my heart. *Guardian.*

Thus *artists* melt the sullen ore of lead,
With heaping coals of fire upon its head;
In the kind warmth, the metal learns to glow,
And loose from dross the silver runs below. *Parnell.*

Sweet *artless* songster! thou my mind dost raise
To airs of spheres, yea, and 'o angels's lays. *Drummond.*

In oratory, the greatest *art* is to hide *art*. *Swift.*
If we compare two nations in an equal state of civilisation, we may remark that where the greater freedom obtains, there the greater variety of *artificial* wants will obtain also. *Cumberland.*

The merchant, tradesman, and *artisan* will have their profit upon all the multiplied wants, comforts, and indulgences of civilised life. *Id.*

In every quarter of this blessed isle,
Himself [the mind] both present is and president,
Nor once retires, a happy realm the v.
That by no officers lewd ravishment,
With greedie lust and wrong consum'd
He all in all, and all in every part,
Does share to each his due and equal dole compart. *Fletcher's Purple Island.*

Among the several *artifices* which are put in practice by the poets, to fill the minds of an audience with terror, the first place is due to thunder and lightning. *Addison.*

Poets, like painters, thus unskill'd to trace
The naked nature and the living grace,
With gold and jewels cover ev'ry part,
And hide with ornaments their want of *art*. *Pope's Essay on Criticism.*

O still the same Ulysses, she rejoin'd;
In useful craft successfully refin'd;
Artful in speech, in action, and in mind. *Pope.*
Embosom'd in the deep where Holland lies,
Methinks her patient sons before me stand,
Where the broad ocean leans against the land,
And sedulous to stop the coming tide,
Lift the tall rampire's *artificial* pride. *Goldsmithe.*

A man will no more carry the *artifice* of the bar into the common intercourse of society, than a man who is paid for tumbling on his hands will continue to tumble when he should walk on his feet. *Johnson.*

He feels no ennobling principle in his own heart, who wishes to level all the *artificial* institutions which have been adopted for giving a body to opinion, and permanence to fugitive esteem.

Burke.

ART has been more particularly defined to be a habit of the mind prescribing rules for the due production of certain effects ; or the introducing the changes of bodies from some fore-knowledge and design in a person endued with the principle-or faculty of acting. The word has been sometimes derived from *αριστη*, utility, profit ; and is found in that sense in Aeschylus.

According to lord Bacon it is a proper disposition of the things of nature by human thought and experience, so as to make them answer the designs and uses of mankind. Nature, according to that philosopher, is sometimes free, and at her own disposal ; and then she manifests herself in a regular order ; as we see in the heavens, plants, animals, &c.—Sometimes she is irregular and disorderly either through some uncommon accident or depravation in matter, when the resistance of some impediment perverts her from her course ; as in the production of monsters. At other times she is subdued and fashioned by human industry, and made to serve the several purposes of mankind. This last is what we call art. In which sense, art stands opposed to nature. Hence the knowledge of nature may be divided into the history of generation, of pretergeneration, and of arts. The first considers nature at liberty ; the second her errors ; and the third her restraints.

Art has been distinguished from science ; by the latter being regarded as furnishing the principles of all art. Or science, scientia, all human knowledge, is said to be divisible into those purer sciences which relate to the ideas or laws of the mind, and the relation they bear to each other ; and the mixed or applied sciences—that relation which the same ideas bear to the external world. In this view the mixed and applied sciences are but other terms for all the fine and useful arts. Chambers has observed long ago, in the excellent preface to his original Cyclopædia: An Art ~~and~~ a Science, only seem to differ as less and more pure : a science is a system of deductions made by reason alone, undetermined by any thing foreign or extrinsic to itself : an art, on the contrary, requires a number of data, and postulata, to be furnished from without ; and never goes any length, without at every turn needing new ones. It is, in one sense, the knowledge and perception of these data that constitutes the art ; the rest, that is, the doctrinal part, is of the nature of science ; which attentive reason alone will descry. An art, in this light, appears to be a portion of science, or general knowledge, considered, not in itself as science, but with relation to its circumstances or appendages. In a science the mind looks directly backwards and forwards to the premises and conclusions : in an art we also look laterally to the concomitant circumstances. A science, in effect, is that to an art, which a stream running in a direct channel, without regard to any thing but its own progress, is to the same stream turned out of its proper course, and disposed into cascades, jets, cisterns, ponds, &c. In

which case the progress of the stream is not considered with regard to itself, but only as it concerns the works ; every one of which modifies the course of the stream, and leads it out of its way. It is easy to trace the progress of the former, from its issue, as it flows consequentially ; but a man ever so well acquainted with this will not be able to discover that of the latter, because it depends on the genius, humor, and caprice of the engineer who laid the design.'

The learned author of Hermes says, If it be asked, What art is ; we have to answer, 'It is an habitual power in man, of becoming the cause of some effect, according to a system of various and well-approved precepts.' If it be asked, On what subject art operates ; we can answer, 'On a contingent, which is within the reach of the human powers to influence.' If it be asked, For what reason, for the sake of what, art operates ; we may reply, 'For the sake of some absent good, relative to human life, and attainable by man, but superior to his natural and uninstructed faculties.' Lastly, if it be asked, 'Where it is the operations of art end ?' We may say, 'Either in some energy, or in some work.' —Harris's *Three Treatises*, dialogue i.

Arts are properly divided into liberal and mechanical.

ARTS, LIBERAL, OR POLITE, are those that are noble or ingenious, and worthy of being cultivated for their own sake, without any immediate regard to any pecuniary emolument. Such as depend more on the imagination, or on the labor of the mind, than on that of the hand ; or that consist more in speculation than operation, and have a greater regard to amusement and curiosity than necessity. Such are poetry, music, painting, grammar, rhetoric, the military art, architecture, and navigation. They were formerly to be summed up in the following Latin

Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Astra.

In the eighth century the whole circle of sciences was composed of the seven liberal arts, as they were called ; viz. grammar, rhetoric, logic, arithmetic, music, geometry, and astronomy ; the three former of which were distinguished by the title of trivium, and the four latter by that of quadrivium.

ARTS, MECHANICAL, are those wherein the hand and body are more concerned than the mind ; and which are chiefly cultivated for the sake of the profit attending them. Of which kind are most of those which furnish us with the necessities of life, and are popularly known by the name of trades and manufactures. Such are weaving, turnery, brewing, masonry, clock-making, carpentry, joinery, foundry, printing, &c. These arts, which indeed are innumerable, were formerly comprised in this verse.

Rus, Nodus, Arma, Faber, Vulnera, Lana, Rates.

They take their denomination from *μηχανη*, machine, as being all practised by means of some machine or instrument. With the liberal arts it is otherwise ; there being several of them which may be learnt and practised without any

instrument at all ; as logic, eloquence, medicine, properly so called, &c.

Lord Bacon has observed that the arts which relate to the sight and hearing are reputed liberal, beyond those which regard the other senses, and are chiefly employed in matters of luxury ; these are usually called the fine arts ; such are poetry, painting, sculpture, music, gardening, and architecture.

As all arts have this common property according to Mr. Harris, that they respect human life, it is evident that some contribute to its necessities, as medicine and agriculture ; and others to its elegance, as music, painting, and poetry. The former seem to have been prior in time to the latter. Men must naturally have consulted how to live and to support themselves, before they began to deliberate how to render life agreeable. Indeed this is confirmed by fact ; as no nation has been known so barbarous and ignorant as not in some degree to have cultivated the rudiments of these necessary arts ; and hence possibly they may appear to be more excellent and worthy, as having claim to a preference derived from their seniority. The arts, however, of elegance are not destitute of pretensions, if it be true that nature formed us for something more than mere existence. Nay farther, if well-being be clearly preferable to mere being, and this, without the other, be contemptible, they nay have reason perhaps to aspire even to a superiority. *Harris, ubi supra, p. 54.*

The history of the origin and progress of particular arts is recited under their respective denominations in the course of this work. It may be here observed however, in general, that most of the arts that are necessary to the subsistence, or conducive to the convenience and comfort of mankind, have had a very early origin.

Some useful arts must be nearly coeval with the human race ; for food, clothing, and habitation, even in their original simplicity, require some art. Many others are of such antiquity as to place the inventors beyond the reach of tradition. Several have gradually crept into existence without any recorded inventor or history. The busy mind, however, accustomed to a beginning in all things, cannot rest till it finds or imagines a beginning to every art.

It has been generally admitted that the arts had their rise in the East, and that they were conveyed from thence to the Greeks, and from them to the Romans. The Romans, indeed, seem to have been chiefly indebted to the Greeks, by whom they were excelled in point of invention. The Romans acknowledged this superiority, for they sent their youth to Greece in order to finish their education ; and from this circumstance we may infer, that they considered that country as the seat of the arts and sciences, and as a school where genius would be excited by the most finished models, and the taste corrected and formed. Pliny and other writers have, nevertheless, given hints which lead us to believe that the Romans possessed a more extensive knowledge of the arts than modern writers are sometimes willing to allow ; and that several inventions regarded as recent are only old ones revived and again applied to practice. The dark ages at once

extinguished the knowledge of the past, and retarded the revival of art ; yet it cannot be denied, that several important discoveries altogether unknown to the ancients were made in those ages. Of this kind were the inventions of paper, painting in oil, the mariner's compass, gunpowder, printing, and engraving on copper : see the several articles. After the invention of the compass and printing, two grand sources were opened for the improvement of science. As navigation was extended, new objects were discovered to awaken the curiosity and excite the attention of the learned ; and the ready means of diffusing knowledge afforded by the press, enabled the ingenious to make them publicly known. Ignorance and superstition, the formidable enemies of philosophy in every age, began to lose some of that power which they had usurped, and different states, forgetting their former blind policy, adopted improvements which their prejudices had before condemned.

In countries, however, where civil and ecclesiastical tyranny prevailed, the progress of the useful and elegant arts was slow, and struggled with many difficulties. Particular events, indeed, have occurred in all ages and nations which have roused the exertions of genius, and furnished occasion for making important and useful discoveries. The history of Greece and Rome, and even of modern Europe, will afford many obvious facts that confirm and illustrate this observation. We can add but a few other miscellaneous ones.

In different countries the progress of the same arts has been extremely different. Though the compass was used in China for navigation long before it was known in Europe, yet to this day, instead of suspending it in order to make it act freely, it is placed upon a bed of sand, by which every motion of the ship disturbs its operation. Water-mills for grinding corn are described by Vitruvius, and wind-mills were known in Greece and in Arabia as early as the seventh century ; yet no mention is made of them in Italy till the fourteenth ; and that they were not known in England in the reign of Henry VIII. appears from a household book of the Northumberland family, stating an allowance for three mill-horses, 'two to draw in the mill, and one to carry stuff to the mill and fro.' Water-mills for corn must in England have been of a late date. The ancients had mirror-glasses, and employed glass to imitate crystal vases and goblets ; yet they never thought of using it in windows. In the thirteenth century, the Venetians were the only people who had the art of making crystal glass for mirrors. A clock that strikes the hours was unknown in Europe till the end of the twelfth century. And hence the custom of employing men to proclaim the hours during night ; which to this day continues in Germany, Flanders, and England. Galileo was the first who conceived an idea that a pendulum might be useful for measuring time ; and Huygens was the first who put the idea in execution, by making a pendulum clock. Hook, in 1660, invented a spiral spring for a watch, though a watch was far from being a new invention. Paper was made no earlier than the fourteenth century ; and the invention of printing was a century later. Silk manufactures were

with unabating fury, and destroyed 400 galleys, besides a vast number of store-ships and transports. However, 800 ships of war, besides innumerable vessels of burden, sailed into the Peganian bay and anchored in the road of Aphete, directly opposite to the harbour of Artemisium. The Grecians had posted sentinels on the heights of Eubœa, to observe the consequences of the storm, and to watch the motions of the enemy. When informed of the disaster which had befallen them they poured out a joyful libation, and sacrificed, with pious gratitude, to ' Neptune the Deliverer.' The Persians, however, having recovered from the terrors of the storm, prepared for battle; and, as they entertained not the smallest doubt of conquering, they detached 200 of their best sailing vessels round the isle of Eubœa, to intercept the expected flight of the enemy through the narrow Euripus. About sunset the Grecian fleet approached in a line, and the Persians met them with the confidence of victory, as their ships were still sufficiently numerous to surround those of their opponents. At their first signal the Greeks formed into a circle, at the second they began the fight. Though crowded into a narrow compass, and having the enemy on every side, they soon took thirty of their ships, and sunk many more. Night came on, accompanied with an impetuous storm of rain and thunder; the Greeks retired into the harbour of Artemisium; the enemy were driven to the coast of Thessaly. By good fortune however, rather than by design, the greatest part of the Persian fleet escaped immediate destruction, and gained the Peganian bay; but the ships ordered to sail round Eubœa met with a more dreadful disaster. They were overtaken by the storm, after they had ventured farther from the shore than was usual with the wary mariners of antiquity. Clouds soon intercepted the stars, by which alone they directed their course; and after continuing during the greatest part of the night the sport of the elements, they all perished miserably amidst the shoals and rocks of an unknown coast. The morning arose with different prospects and hopes to the Persians and Greeks. To the former it discovered the extent of their misfortunes; to the latter it brought a reinforcement of fifty-three Athenian ships. Encouraged by this favorable circumstance, they determined again to attack the enemy at the same hour as on the preceding day, because their knowledge of the coast, and their skill in fighting their ships, rendered the dusk peculiarly propitious to their designs. At the appointed time they sailed towards the road of Aphete; and having cut off the Cilician squadron from the rest, totally destroyed it, and returned at night to Artemisium. The Persian commanders being deeply affected with their repeated disasters, but still more alarmed at the much dreaded resentment of their king, determined to make one vigorous effort for restoring the glory of their arms. By art and stratagem, and under favor of the night, the Greeks had hitherto gained many important advantages. It now belonged to the Persians to choose the time for action. On the third day, at noon, they sailed forth in the form of a crescent, still sufficiently extensive to infold the Grecian

line. The Greeks, animated by former success were averse to decline any offer of battle; yet it is probable that their admirals, and particularly Themistocles, would much rather have delayed it to a more favorable opportunity. Rage and resentment supplied the defect of the barbarians in skill and courage. The battle was longer, and more doubtful, than on any former occasion; many Grecian vessels were destroyed, five were taken by the Egyptians, who particularly signalled themselves on the side of the barbarians, as the Athenians did on that of the Greeks. The persevering valor of the latter at length prevailed, the enemy retiring, and acknowledging their superiority, by leaving them in possession of the dead and the wreck. But the victory cost them dear; since their vessels, particularly those of the Athenians, were reduced to a very shattered condition; and their great inferiority in the number and size of their ships made them feel more sensibly every diminution of strength.'

ARTEMISIUM, a town of Cœnotria, now called St. Agatha, in Calabria, on the river Pisaurus, or la Foglia, eight miles distant from the Tuscan sea.

ARTEMISIUM, an ancient town of Spain, on the sea-coast of Valencie, called also Dianium, and now Denia, possessed by the Contestani.

ARTHOCHUS, a Syrian who resembled Antiochus, king of Syria, so exactly, that by the contrivance of his queen Laodice, he personated him after his death, and thus obtained the kingdom.

ARTEMON, the founder of the sect of Artemonites, a sect of Unitarians who flourished about the year 210.

ARTEMUS, a promontory of Valencia, called also Cabo St. Martin, and Punta del' Emperador.

ARTENNA, in ornithology, the name of a water-bird, of the size of a hen, of a brownish color on the back, and white on the belly; having a crooked bill, and its three fore toes connected by a membrane, but the hinder one loose. It is found on the island Tremiti, in the Adriatic sea, and is supposed to be the avis Diomedis of the ancients.

ARTERIA ASPERA, **ARTERIA BRONCHIALIS**, &c. See ANATOMY, Index.

ARTERIA VENOSA, a name given by the ancients to the pulmonary vein, on the erroneous supposition of its being an air-vessel, and that it served for the conveyance of the vital aura from the lungs to the heart.

ARTERIACA, **ARTERIACS**. Medicines for disorders of the trachea, and the voice. Arteriacs are reduced by Galen into three kinds: 1. Such as are void of acrimony, serving to mollify the asperities of the part; such as gum tragacanth, aster samias, starch, milk, &c. 2. Those of an acrimonious quality, whereby they stimulate even the sound parts; such as honey, turpentine, bitter almonds, iris root, &c. 3. Those of an intermediate kind, soft and mild, yet detergent; such as butter, and preparations of almonds, honey, &c.

ARTERIOSA VENA, or **ARTERIAL VEIN**, a denomination given to the pulmonary artery.

ARTERIOSUS CANALIS, a tube in the heart of the fetus, which, with the foramen ovale, serves to maintain the circulation of the blood, and to divert it from the lungs.

ARTERY, { *Aorypia, spiritus semita*, according to Pliny and Cicero. The moderns have a more accurate knowledge of the human body than this bare and inadequate definition of the ancients affords. See ANATOMY for a complete view of the arteries.

Universal plodding prisons up

The nimble spirits in the arteries.

Shakespeare. Love's Labour Lost.

Had not the Maker wrought the springy frame ;
The blood, defrauded of its nitrous food,
Had cool'd and languished in the arterial road.

Blackmore.

As this mixture of blood and chyle passeth through the arterial tube, it is pressed by two contrary forces ; that of the heart driving it forward against the sides of the tube ; and the elastic force of the air, pressing it on the opposite sides of those air-bladders, along the surface of which this arterial tube creeps.

Arbuthnot.

ARTHEL, in law, something cast into a court, in Wales, or its marches, whereby the court is letted or discontinued for the time. The casting of arthel is prohibited, 26 Hen. VIII. cap. 6.

ARTHINGTON (Henry), a fanatical gentleman of Yorkshire, who, towards the end of queen Elizabeth's reign, engaged in treasonable practices against the government, with Edward Coppinger a servant of the queen's, and one Hacket, whom, in their fanaticism they styled ' king of Europe ! ' Supposing themselves to be inspired, Coppinger styled himself the ' prophet of mercy,' and Arthington the ' prophet of judgment ! ' Arthington accordingly wrote and published his prophecies, wherein were intermingled some severe reflections against the lords of the privy council, the judges, &c. They were at last all three apprehended in July, 1591 ; when Coppinger became quite deranged, and never recovered his senses. Hacket was tried, condemned, and executed ; and Arthington hearing of this, wrote a submissive letter to the lords of council, which, after some time, procured him the queen's pardon. He died with the character of an honest but weak man.

ARTHITICA, in botany, a name given by some to the primrose, and by others to the ground pine.

ARTHITICAL, { *Aorþeric*, pain or disease

ARTHITICK. } which attacks the joints, from *aorþov*, a joint.

Frequent changes produce all the *arthritic* diseases.

Arbuthnot.

Serpents, worms, and leeches, though some want bones, and all extended articulations, yet have they *arthritical* analogies ; and, by the motion of fibrous and muscular parts, are able to make progression.

Brown's Vulgar Errors.

Unhappy ! whom to beds of pain

Arthritic tyranny consigns ;

Whom smiling nature courts in vain,

Though rapture sings and beauty shines.

Johnson's Ode on Spring.

ARTHRITIS ; from *aorþov*, a joint ; any distemper that affects the joints, but the gout particularly. *

ARTHRITIS PLANETICA, **ARTHRITIS VAGA**, the wandering gout, that gives pain sometimes in one limb, and sometimes in another.

ARTHRODIA, in anatomy, a species of articulation, wherein the flat head of one bone is

received into a shallow socket in the other. The humerus and scapula are joined by this species of articulation. See ANATOMY, Index.

ARTHRODIA, in natural history, a genus of imperfect crystals, found always in complex masses, and forming long single pyramids, with very short and slender columns.

ARTHRODIA, in zoology, a class of animalculæ, containing those with visible limbs.

ARTHRON ; *aorþov*, Greek ; a joint, or connection of bones proper for motion.

ARTHROSIS, in anatomy, a juncture of two bones designed for motion ; called also articulation. See ARTHRODIA.

ARTHUR, the celebrated hero of the Britons, is said to have been the son of Uter, named Pendragon, king of Britain, and to have been born in 501. His life is a continued scene of wonders. He killed 470 Saxons with his own hand in one day; and after having subdued many mighty nations, and instituted the order of the knights of the Round Table, died A.D. 542, of wounds which he received in battle. The most particular detail of his story and his exploits is that given by Geoffrey of Monmouth ; but his history is so blended with the marvellous and the extravagant, that not only the truth of the whole, but even the reality of Arthur's existence, has been called in question. The ingenious Mr. Whitaker however believes in his institution of the celebrated order of the round table, as also that it was the origin of others of the like kind on the continent.

ARTHUR'S SEAT, a high hill in the neighbourhood of Edinburgh, said to have been so denominated from a tradition that king Arthur surveyed the country from its summit, and had also defeated the Saxons in its neighbourhood. This hill rises by a steep and rugged ascent, till it terminates in a rocky point near 700 feet from the base, being more than double the height of the cross on the top of St. Paul's, London, which is 340 feet. On the south it is in many parts a perpendicular rock, composed of basaltic pillars, regularly pentagonal or hexagonal, about three feet in diameter, and from forty to fifty feet in height. Contiguous upon the west, and partly connected with it at the base, are Salisbury crags, of inferior height but exhibiting an appearance equally singular and grand. They present to the city an awful front of broken rocks and precipices, forming a sort of natural amphitheatre of solid rock ; and backward from the craggy verge above, the hill forms an extensive irregular slope, the surface affording pasture to numerous flocks of sheep. The crags, beside ores, spars, rock-plants, and here and there it is said some precious stones, afford an inexhaustible supply of granite for paving the streets, &c. In quarrying a part of the crags has been worn down into a spacious shelf, having the appearance of a lofty terrace, and stretching a considerable length. From hence is a near and distinct prospect of the city with its environs and the adjacent country. But from the pinnacle called Arthur's Seat the view is more noble and extensive. The traveller may here sit and survey at his ease the centre of the kingdom, besides having a complete view of Edinburgh and its castle, on which he looks down as if seated among the

clouds. In a word, the German ocean, the whole course of the Forth, the distant Grampians, and a large portion of the most populous and best cultivated part of Scotland, form a landscape sublime, various and beautiful. The denomination of this hill, derived as above, has been adduced as an argument against those who dispute the existence of the British Arthur. That derivation, however, though probable, is not without uncertainty. For Arthur's Seat is said to be derived, or rather corrupted, from A'rd Seir, 'a place or field of arrows,' where people shot at a mark: and this not improbably; for among these cliffs is a dell or recluse valley, where the wind can scarcely reach, now called the Hunter's bog, the bottom of it being a morass. The adjacent crags are supposed to have taken their name from the earl of Salisbury, who, in the reign of Edward III. accompanied that prince in an expedition against the Scots; though, according to others, the genuine derivation, like that of Arthur's seat, is from a Celtic word also corrupted.

ARTICHOKE, in botany. See **CINARA**.

ARTICLE, *v. & n.*

Lat. *articulus*, a diminutive of *artus*, a

ARTICULATE, *v. & adj.*

ARTICULATED, *joint*. To enter into,

ARTICULATION, *draw up or state par-*

ticulars, to make terms. To articulate is to pro-

nounce each portion of a sentence distinctly.

PROSPERO. Hast thou, spirit,

Performed to point the tempest that I bad thee.

ARIEL. To every *article*. *Shakespeare. Tempest.*

Henry's instructions were extreme curious and *articulate*, and in them more articles touching inquisition, than negotiation; requiring an answer in distinct articles to his questions.

Bacon.

In speaking under water, when the voice is reduced to an extreme exility, yet the *articulate* sounds, the words, are not confounded.

Id.

The first, at least, of these I thought deny'd
To beasts; whom God, on their creation day,

Created mute to all *articulate* sound.

Milton.

Antiquity expressed numbers by the fingers on either hand. On the left they accounted their digits and *articulate* numbers unto an hundred; on the right hand, hundreds and thousands.

Brown's Vulgar Errors.

If it be said, God chose the successor, that is manifestly not so in the story of Jephtha, where he *articled* with the people, and they made him judge over them.

Locke.

By *articulation* I mean a peculiar motion and figure of some parts belonging to the mouth, between the throat and lips.

Holder.

All the precepts, promises, and threatenings of the gospel, will rise up in judgment against us; and the *articles* of our faith will be so many *articles* of accusation; and the great weight of our charge will be this, That we did not obey the gospel, which we professed to believe; that we made confession of the Christian faith, but lived like Heathens.

Tillotson.

You have small reason to repine upon that *article* of life.

Swift.

The dogmatist knows not by what art he directs his tongue, in *articulating* sounds into voices.

Glanville.

In the mean time they have ordered the preliminary treaty to be published, with observations on each *article*, in order to quiet the minds of his people.

Steele.

ARTICLE, in grammar, is a particle used in most languages for the declining of nouns, and denoting their several cases and genders. The

use of them chiefly arises in languages that have no different terminations to express the different circumstances of nouns. The Latins have no articles; but the Greeks, and most of the modern languages, have had recourse to them for fixing and ascertaining the vague signification of common and appellative names. Many have been the controversies among grammarians upon the use and meaning of these words. Mr. Harris, whose knowledge was derived from the Greek language and Greek grammarians, and whose principles are contradicted by the slightest acquaintance with the Teutonic and Arabic, leads us through many a maze; and we might have wandered till this moment, if Mr. Tooke, in his observations on the word *that*, in his *Epea Pteroenta*, had not pointed out to us the open and straight road upon this subject. In the English language we call the words *a* and *the* articles; the Germans have *ein* and *der*; the French *un* and *le*; the Greeks *o*; the Hebrews *n*: but the unfortunate Latins are said to be without these joints and pegs in speech. But if one language is without them, they are, it is evident, not essential to language; and it will be found difficult to make such a definition as shall exclude a variety of words, such as *hic*, *this*, *that*, &c. from making a part of this division. In the languages above-mentioned the precise meaning of the words *the*, *der*, *le*, *o*, and *n*, cannot at first sight be ascertained. The English word *a* points obscurely to its meaning, but the German *ein* and the French *un* clear the road for investigation. They are to be found continually applied to substantives, and mean *one*. If a thing is generally reported, we say in English, 'they say,' meaning a great number say so: and so in French it is *on dit*, or *unus dicit*, 'one person says so,' meaning more than one person by an ellipsis very common in that language: in German it is *man sagt*, by man, meaning man in general. We have thus found, that in two languages one of the articles is merely a word of number. Probably it may be so in English; *a* may mean *one*, or it is an abbreviation of *any*. By trying the two senses it is evident that *any* cannot be applied in the room of *a*, but that *one* always can: and hence we might conclude that *a* and *an* are only other words for *one*, and answer to the German *ein*.

The article *the*, as it is called, may not discover itself so easily. Yet let us try the same analogy, for the etymology of it is not ascertained. The answers to *der* of the Germans, and *le* of the French: but what is *le*? the *ille* of the Latins; and hence we may reasonably presume that our word *the* is no more an article than *ille*, and in fact that it comes from some adjective of the same signification. Let us try by etymology. In German we have *der*, *die*, *das*; which was anciently *ther*, *thia* (*thio thiu*) *thaz*, and in the plural *thie* (*thier*). This looks very much like our *the*. In the Anglo-Saxon we find *sa*, *seo*, *that*: in Icelandic, *sa*, *su*, *that*: in Gothic, *sa*, *so*, *thata*: in Hebrew, *וְהַ*, *וְהָ*, *וְהִ*: etymologists perhaps will not be displeased at our making the words *וְהַ* and *the* proceed from the same original; and we shall not be afraid of exposing ourselves to the laughter of critics, if we refer the Doric *την* to the same stock. If we

are right in our conjectures, the word *the* is as much a pronoun as the *ille* of the Latins; but, if persons choose to have a distinct class of words under the name of articles, we may say that the English has two, *a* and *the*, which 'serve to define and ascertain any particular object, so as to distinguish it from the other object of the general class to which it belongs.'

Father Buffier distinguishes a third kind of articles in French, which he calls intermediate or partitive, serving to denote part of the thing expressed by the substantives they are added to; as, *des r̄eavants ont cru*, 'some learned men have supposed'; I want *de la lumière*, 'some light.' The use and distinction of the definite and indefinite articles *le* or *la*, and *de* or *du*, make one of the greatest difficulties in the French language; as being entirely arbitrary, and only to be acquired by practice.

The most philosophical and probable account is that which has been so ably illustrated by the learned bishop Middleton; viz. that it is neither more nor less than the demonstrative or relative pronoun, for both were originally the same. The article, together with its adjunct, forms in fact a proposition, in which the participle of existence is either expressed or understood, and which involves a relation to something *quare* said by the speaker, or which is supposed to pass in the mind of the speaker. Thus, γέρων signifies generally 'old man'; but δός γέρων is equivalent to δός γέρων ὅν, where the pronoun δός, 'this,' implies that the old man now spoken of has been mentioned before, or that he is in some way or other known to the hearer or the speaker.

ARTICLE, ARTICULUS, in anatomy, a joint, or juncture, of two or more bones of the body.

ARTICLE, in arithmetic, sometimes signifies the number 10, or any number justly divisible into ten parts, as 20, 30, 40, &c.

ARTICLE OF FAITH is by some defined a point of Christian doctrine, which we are obliged to believe as having been revealed by God himself, and allowed and established as such by the church. The thirty-nine articles were founded, for the most part, upon a body of articles compiled and published in the reign of Edward VI. They were first passed in the convocation, and confirmed by royal authority in 1562. They were afterwards ratified anew in the year 1571, and again by Charles I. The law requires a subscription to these articles of all persons ordained to be deacons or priests, 13 El. cap. 12; of all clergymen inducted to any ecclesiastical living, by the same statute; and of licensed lecturers and curates, 13 El. cap. 12 and 13, and 14 Ch. II. cap. 4; of the heads of colleges, of chancellors, officials and commissaries, and of schoolmasters. By 1 William III. cap. 10. dissenting teachers are to subscribe to all except the thirty-fourth, thirty-fifth, and thirty-sixth, and part of the twentieth, and in the case of Anabaptists, except also part of the twenty-seventh; otherwise they are exempted from the benefits of this act of toleration. See CHURCH OF ENGLAND.

ARTICLES OF THE CLERGY, ARTICULI CLERI, are certain statutes touching persons and causes ecclesiastical, made under Edw. II. and III.

ARTICLES OF LAMBETH were nine articles on the subject of predestination, and the limitation

of saving grace, which were drawn up by archbishop Whitgift, and recommended to the attention of the students of Cambridge, in consequence of some disputes which were raised in the university at that time on the above-mentioned points. They were, however, merely declaratory of the doctrines of the church of England, and were not imposed as of public authority.

ARTICULARIS NERVUS. See ANATOMY, Index.

ARTICULATE SOUNDS are such as express the letters, syllables, or words, of an alphabet or language: such are formed by the human voice, and by some few birds, as parrots, &c.

ARTICULATED LIBEL, libellus articulatus, in law, that wherein the parts of a fact are set forth to the judge in short, distinct articles.

ARTICULATION, in anatomy. See ANATOMY, Index.

ARTICULATION, in botany, is the connexion of parts that consist of joints or knees, such as the pods of French honey-suckles, which, when ripe, divide into so many parts as there are knees or joints; also those parts of plants which swell into nodes or joints, and which usually send forth branches.

ARTICULATION, in grammar, a distinct pronunciation of words and syllables.

ARTIFICERS, among the Romans, had their peculiar temples, where they assembled and chose their own patron, or advocate, to defend their causes; they were exempted from all personal services. Taruntenus Paternus reckons thirty-two species of artificers, and Constantine thirty-five, who enjoyed this privilege. Artificers were held a degree below merchants, and argentarii or money-changers, and their employment more sordid. Some deny, that in the earliest ages of the Roman state, artificers were ranked in the number of citizens: others, who assert their citizenship, allow that they were held in contempt, as being unfit for war, and so poor that they could scarcely pay any taxes. For which reason they were not entered among the citizens in the censor's books; the design of the census being only to see what number of persons were yearly fit to bear arms, and to pay taxes towards the support of the state. In almost all ages, till the present, and under most forms of government, artificers have been too little respected. By means of the arts, the minds of men are engaged in inventions beneficial to the whole community; and thus prove the grand preservative against that barbarism and brutality, which ever attend indolence and induce stupidity. Razmazini has a treatise on the diseases of artificers.

ARTIFICIAL DAY, the time between the sun's rising and setting in any position of the hemisphere.

ARTIFICIAL LINES, on a sector or scale, are lines so contrived as to represent the logarithmick lines and tangents; which, by the help of the line of numbers, solve, with tolerable exactness, questions in trigonometry, navigation, &c. Chambers

ARTIFICIAL MUSIC, that which is according to the rules of art; or executed by instruments invented by art. It is also used, in another sense, for some artful contrivance in music; as when a piece is sung in two parts; one of which is by B molle, or flat and the other by B sharp.

A R T I L L E R Y.

ARTILLERY. Fr. *artillerie*. Of doubtful origin.

Hath not heard great ordnance in the field?
And heavn's artillery thunder in the skies?

Shakespeare.

I'll to the tower with all the haste I can,
To view th' artillery and ammunition. *Id.*

And Jonathan gave his artillery unto his lad, and said unto him; Go, carry them unto the city. *i Samuel.*

As when two black clouds
With heaven's artillery fraught, come rattling on
Over the Caspian, then stand front to front
Hov'ring a space, till winds the signal blow
To join their dark encounter in mid-air.

Milton's Paradise Lost, b. ii.

Upon one wing the artillery was drawn, being sixteen pieces; every piece having pioneers, to plain the ways. *Hayward.*

He that views a fort to take it,
Plants his artillery against the weakest place. *Denham.*

ARTILLERY, in its general sense, denotes 1. The offensive apparatus of war, particularly of the missile kind. Among the French the term was anciently appropriated to archery. In its modern signification it denotes certain firearms mounted on carriages and ready for action, with their balls, bombs, grenades, rockets, &c. 2. In a more extensive meaning, it includes the means which facilitate their motion and transport, the vehicles over which they traverse rivers, every thing, in short, necessary to them, or that belongs to a train of artillery. 3. In a sense still more extensive, the word comprehends the men and officers destined for the service of the artillery. 4. By the term artillery is likewise understood the science which the officers of artillery ought to possess.

Sect. I.—OF ANCIENT MISSILES AND MILITARY ENGINES.

The missiles of the ancients were of three kinds, viz. on the principle of the cross-bow, the sling, and the recoil of twisted ropes. The first sent forward darts and sometimes combustible arrows; the second was the balista kind, hereafter described; the third acted like the boy's bone bow, which by means of a wooden lever and a twisted string ejects a plum-stone. Dr. Meyrick has had the good fortune to meet in an ancient manuscript with actual delineations of the leading kinds of these engines used in the middle ages. The balista seems only to have been a large beam, rather crooked, resting at about two-thirds of its length on a forked support; if of three legs, then called trepied. Plate, ANCIENT ARTILLERY, fig. 1. At the long end was a great pear-shaped bag, tied to the beam by a stout rope. At the short end was a large box full of stones. The long end being suddenly released, slung upon the enemy the contents of the bag, through being jerked up by the great weight of the stone box. The onager, fig. 2, threw a like bag of stones, but there was no stone-box, the beam being impelled by its position between

twisted ropes inclined to recoil. Besides stones, were also used balls of earth, probably baked pelotes, corrupted into pellets and bullets. It will be sufficient therefore to enumerate shortly the machines, though it is to be recollected, that ancient authors are perpetually confounding the appellations. The arbalest is described in 1342 as a large cross-bow, furnished with a hundred gogions, or balls, and grapple to draw it up.

The balista is said to be a Phoenician invention for throwing huge stones, confounded sometimes with the catapult, which threw darts, a Syrian contrivance, conveyed to the Syracusans, whence it was brought into Greece by Philip of Macedon. Accounts of the construction vary, but the crossbow principle of action seems the most probable. The scorpio was a smaller kind of catapult. In the middle ages, besides the balista, catapult, onager, and scorpion, Grose mentions the mangona, and its diminutive mangonel, similar to the balista. The trebuchet or trip-getis, for throwing stones, which seems to have been the same as the trepied, before mentioned, though Dr. Meyrick says the term trebuchet, appears to imply a military engine, which ejected its ammunition from a trap-door, trebocchetto. The petriary, matafunda, bugles or bibles, couillart, and war-wolf (in one sense) also machines for ejecting stones. The bricolle, carreaux or quarrels, and the espringal, calculated for throwing large darts, called muchette; and sometimes viretons, i. e. arrows with the feathers put diagonally so as to occasion them to turn in the air, but it was not limited to darts; for according to Dr. Meyrick, v. ii. p. 53, in 1342 the gates and towers of Norwich were furnished with thirty espringolds for casting great stones, and to every espringold a hundred gogions or balls fastened up in a box, with ropes and other accoutrements belonging to them; which illustrates the construction before given. The robinet and mate-griffon (i. e. destroyer of the Greeks) threw both darts and stones.

The manu-balista, or cross-bow, supposed to be of Sicilian and Cretan origin, was perhaps the most important machine of this kind, and introduced into Europe by the Crusades. It was known in England, at least for use in the chase, as early as the time of the Conquest. Its application to warlike uses (not its introduction) by Richard I. is well supported; it was used in Italy in 1139. A legionary soldier appears on an ancient seal endeavouring to bend the arcubalist with his foot. Five years earlier, mention is made of turni balisterii, or the arbaleste-a-tour, that drawn up by a turn; and in 1320, of the balista grossa de molinellis, or one wound by a moulinet or windlass, see fig. 6, and the balista grossa de arganellis, i. e. one furnished with tubes for ejecting the Greek fire. The cross-bows used in the reign of Henry VII. were of two kinds; the latch, with its wide and broad bends, for quarrels, and the prodd for lathes. The stock of the former was short and straight,

not much exceeding two feet, and the bow was bent by the windlass or moulinet.

Of the important *battering ram* Pliny and others have made Epeus the inventor, during the siege of Troy; but as it is not mentioned by Homer, nor any Greek writer, Vitruvius and Tertullian more probably assign the invention to Pephsmenon, a Tyrian, in the army of Carthage, during the siege of Cadiz. There were three kinds of rams; one suspended, fig. 5; the second running upon rollers, fig. 3; the third carried by the men who worked it, fig. 5. At Haguenau, and Morviedro, the ancient Saguntum, are the remains of two: one is topped with a strong head of iron, square and of one piece; the other consists of three pieces, has a ram's head, and is similar to one on the arch of Severus. The ram was used in the middle ages; and Sir Christopher Wren, in throwing down old walls, found no machine equal to it, particularly in disjoining the stones. The momentum of one, twenty-eight inches diameter, 180 feet long, with a head of a ton and a half weighed 41,112 lbs. and worked by a thousand men, was about equal to a point-blank shot from a thirty-six pounder.

Hardly, perhaps, to be called artillery, but materially assisting their operations were the ancient *musculus* or *testudo* a covered machine, probably the subsequent sow, a very low shed, long and very sharp roofed; used to advance to the wall, and overturn it by sap. The *pluteus*, a machine covered with ozier work and hides, running upon three wheels, one in the middle, and two at the extremities. The cat, also a covered shed, occasionally fixed on wheels, and used for protecting soldiers employed in filling up the ditch, preparing the way for the movable tower, mining the wall, &c. Some of these cats had crenelles and chinks, from whence the archers could discharge their arrows. These were called castellated cats; and sometimes under cover of this machine, the besiegers worked a small kind of ram; fig. 4. Dr. Meyrick, from an ancient illumination, has engraved one of these, called the chaschateil or cat castle. It resembles in form a modern four-post bedstead upon wheels. A miner is working under it with a pick-axe. And to the same purpose the *vinea*, another shed, was applied.

The *belfragium* or *belfroi*, was a tower with stories, moved up to the walls. A cat, made of ozier twigs and leather, and covered with planks, was used to protect those who filled up the ditches preparatory to wheeling upon them the belfries; from this use of the cat, was derived the French word *eschaufaux*, an elevated floor, and subsequently the English word scaffold. Elsewhere Dr. Meyrick says, the catti versatiles, were chats faulx furnished with drawbridges. The chief belfries were called *brestachiae* or *brestaches*. William de Breton says, he caused to be made double brestaches in seven different places. These were wooden castles, very highly fortified, surrounded with double quadrangular fosses, at a proportionate distance from each other, with drawbridges thrown across them, and he had not only these filled with armed men, but the interior surface of each foss, and

thus he surrounded the besieged by his works. Such wooden castles were also called bastiles. An interesting print of a movable belfroi is given by Grose. It consists of a ground-floor occupied by a ram, and four upper stories by archers and cross-bowmen; the highest story rose above the walls, and from that directly below, a drawbridge was let down, and rested upon the wall; see our fig. 3. Some of these towers used by the early ancients were of amazing magnitude, being with pyramids twenty, fifteen, or ten stages or floors.

The *prickly cat*, or *felis echinata*, was a beam, bristled with oaken teeth, which, being hung at an embrasure, could be let down upon an enemy. For the same purpose was used the *fuscata bellica* or war-hammer, fitted with curved nails and hooks, and suspended by a chain, to draw up the enemy from below.

Missive wheels were formed of mill-stones joined by an oaken axis, and let down upon besiegers; missive chariots were rolled down an inclined plane, and retained by chains to discharge hot or cold stones. In the middle age the machines were commonly made upon the spot. Hogsheads full of stones were used in the reign of Edward I. as a protecting rampart to defend the workmen in sieges.

SECT. II.—OF MODERN ARTILLERY.

According to Du Cange the word artillery (ars telaria, meaning bows, arrows, and all implements of war,) first occurs in Rymer. Grose is confirmed by Dr. Meyrick in assigning the introduction of it to the fourteenth century.

Cannon called *dolia ignivoma*, or fire-flashing vessels, in Spain, were known in Italy as early as the year 1351, and were used by our Edward III. They were termed by the French, *gunnæ*, and appear at first to have been of two kinds—a large one for discharging stones, called a bombard, and a smaller sort for discharging darts or quarrels. In 1377, 1 Richard II. Thomas Norbury was directed to provide from Thomas Restwold of London, two great and two less engines, called cannons, 600 stone shot for the same, and salt-petre, charcoal, and other ammunition, for stores, to be sent to the castle of Bristol. At the first invention of cannon, darts and bolts were shot from them; but, before these, stones were used instead, for, in 1388, a stone bullet, which weighed 195 lbs., was discharged from a bombard called the trevisan.

The *bombard* was so called from the Greek *βούβος*, which expressed the noise it made in the firing. It was a Greek invention, and there is some reason to conceive that gunpowder owed its origin to the same people. At first used only in fire-works amusively, its discovery is involved in obscurity. From a tract on Pyrotechny by Marcus Graeius, Friar Bacon, in 1270, learned that its composition was two pounds of charcoal, one of sulphur, and six of salt-petre, well pulverised and mixed. It was first made in England in the time of Elizabeth. At first it was not corned, but remained in its mealed state. It was then called *serpentine* powder, Meyrick, v. iii. p. 71. The first *bombards* were made of bars of iron, strengthened with welded hoops of the

same metal. They were short with large bores, and were made with chambers, in imitation of the tubes which ejected the Greek fire. These chambers consisted of the lower half of the cylinder, the upper being open for the admission of the can, or canister, which held the charge, from whence probably arose the term cannon. One of these may be seen in the tower of London, and there is another at Rhodes of the sixteenth century, on its original carriage, and a stone ball to fire from it. It is nineteen feet in length, two feet eight inches in diameter, its calibre two feet, and its thickness four inches. About half the length is of a less diameter, and in this, as in a chamber, was placed the powder, while the ball was in the larger part. The carriage was made of timber, placed lengthways, and cramped together. These bombards were the only kind of cannon employed in the fourteenth century, and were of the howitzer kind, in use before mortars. After this invention of bombs, that of carcasses of different kinds soon followed. The former, according to Strada, took place in 1588. Grenades are said to have been first used in 1594 in which year the howitzer was invented by the Germans. The bomb being intended to beat down buildings in its fall, or to break and destroy every thing around it, by the pieces of broken iron scattered in all directions by its explosions, the end proposed by the carcase and grenade was to burn the town by means of fire-balls. The petard for forcing gates was invented in France, a short time before the year 1579, and soon after introduced into England.

The term bombard generally designates battering guns and mortars; but the word is also applied to lighter cannon. Accordingly Dr. Meyrick calls a cannon engraved by Strutt, a bombard on a carriage, light in proportion to the bulk of the piece. Its trail consists of a prolongation of the cascable, which rests on the ground, a block of wood serving as a quoin for the purpose of depression. Admitting that cannon were not used in the field till the fifteenth century, this gun, for it is very small, is the kind to which Froissart alludes, when he mentions two hundred carts loaded with cannon and artillery; cannonades with bars of iron and quarrels headed with brass, and cannon mounted on walls and battlements. The balls were of stone adapted to the calibre. In 1434 it is said that the English had many kinds of projectiles, 'cannons, culverines, and other vuglaires,' more properly vulgaires, the ordinary kind. The scorpion was another sort. In an illuminated copy of the Roman de la Rose, done at the commencement of the reign of Edward IV. 1461, is the delineation of an iron cannon. The piece is placed in a kind of trough, or bed of wood, which is continued to the earth, not unlike a modern horse-artillery trail. Grose very properly says, that most of the earliest cannons were mere cylinders, fixed on sledges and being often composed of iron bars, iron plates rolled, or even jacked leather hooped, could be fired, because they were loaded by chambers fixed in at the breech. At this time they were generally purchased from abroad; and though Henry VII. and VIII. had Flemish gunners to teach the art, yet they did not

understand it upon mathematical principles; and in the sixteenth century the ordnance rarely made more than one discharge, the cavalry being able to charge them before they could load again. Aliens were employed in 1543 in casting great brass ordnance, though one John Owen was said to have so done in 1521. In 1626, 2 Charles I. one Arnold Rotespen had a patent for making guns in a manner before unknown in this kingdom.

Culverines were an early denomination of a species of large cannon; and when the distinction between battering-pieces (all above twelve pounders) and field-pieces commenced, according to Dr. Meyrick, temp. Henry VIII. the appellations were numerous. These names were derived from the tubes which had been used to eject the Greek fire, being fashioned so as to represent the mouths of monsters. The basilisk, the largest, shot stones of 200 pounds weight. It was so denominated from a basilisk sculptured upon it. The shot in this reign consisted of iron, lead, and stone balls; and ladies and sponges were used. Different proportions were given by various nations to pieces of the same denomination; but the following table of Ordnance in the reign of Elizabeth, applies in the main to ~~the~~ ones immediately preceding:

Denomination.	Pounders.	In. Bore.
Cannon Royal	66	8½
Cannon	60	8
Cannon Serpentine	53½	7
Bastard Cannon	41	7
Demi-cannon	33	6½
Cannon Petro'	24	6
Culverin	17½	5½
Basilisk	15	5
Demi-culverin	9½	4
Bastard Culverin	5	4
Sacar	5½	3½
Minion	4	3½
Faulcon	2	2½
Falconet	1½	2
Serpentine	¾	1½
Rabinet	½	½

The change introduced in the military art by the modern artillery, Dr. Smith observes, has enhanced greatly both the expense of exercising and disciplining any particular number of soldiers in time of peace, and that of employing them in time of war. Both their arms and ammunition are become more expensive. A musket is a more expensive machine than a javelin or a bow and arrows; a cannon or a mortar than a balista or a catapulta. The powder which is spent in a modern review, is lost irrecoverably, and occasions a very considerable expense. The javelins and arrows which were thrown or shot in an ancient one, could easily be picked up again, and were besides of very little value. The can-

non and the mortar are not only much dearer, but much heavier machines than the balista or catapulta, and require a greater expense not only to prepare them for the field but to carry them to it. As the superiority of the modern artillery too over that of the ancients is very great, it has become much more difficult, and consequently much more expensive, to fortify a town so as to resist, even for a few weeks, the attack of that superior artillery. In modern war, the great expense of fire-arms gives an evident advantage to the nation which can best afford that expense; and consequently to an opulent and civilised, over a poor and barbarous nation. In ancient times, the opulent and civilised found it difficult to defend themselves against the poor and barbarous nations. In modern times, the poor and barbarous find it difficult to defend themselves against the opulent and civilised. The invention of fire-arms, therefore, an invention, which at first sight appears to be so pernicious, is certainly favorable, both to the permanency and to the extension of civilisation. And, on the whole, the invention of gun-powder and modern artillery may be said to have saved the effusion of human blood. Equestrian engagements (the principles on which cavalry act being nearly the same in every age,) are still similar circumstances to those which appear so extraordinary in the battles of antiquity.

The present artillery of Great Britain is admitted to be the most perfect force of that description in Europe. It was until recently divided into the artillery of the park, the horse artillery, and the battalion guns, viz. all the light pieces of ordnance attached to regiments of the line. This latter description, however, has been discontinued of late, and brigades of foot and horse now comprehend the whole of our regular artillery.

A brigade of foot artillery has either five medium 12-pounders and a heavy 5½-inch howitzer; five 9-pounders and ditto; five long 6-pounders and ditto; five light 6-pounders and a light 5½-inch howitzer; or six 3-pounders when acting in a mountainous district. In the late war the 9-pounders were more generally used, as best opposed to the 8-pounders of the French army. The guns and howitzers are accompanied by ammunition cars, upon a new principle. To every brigade is a forge cart, a camp equipage waggon, and sparegun carriage, with spare wheels, and tools for a wheeler, collar-maker, and carriage-smith. The proportioning of field and battering ordnance, for foreign service, is a business of great importance, from the knowledge which is requisite to fix upon all the numerous articles to accompany the service, and the method to be pursued in equalising, arranging, and disposing of the guns, ammunition, and stores. No certain criterion can ever be established as to the proportion of artillery to be sent upon any expedition, as it must depend entirely upon the nature of the service; and great changes are generally made to suit the ideas of the officer who is to command the army, and also those of the officer of artillery, who may be selected to accompany it. But two brigades of field artillery to a division of an army consisting of 6000 men, may be considered a good proportion, independent of the reserve park.

A troop of British horse artillery has generally five 6-pounders and one light 5½-inch howitzer. The French have generally 8-pounders and a 6-inch howitzer. Each troop consisting of one captain, one second captain, three subalterns, two staff serjeants, twelve non-commissioned officers, seventy-five gunners, forty-six drivers, six artificers, and one trumpeter, with eighty-six draught horses, and fifty-six riding horses, and six pieces of ordnance, with carriages, for the conveyance of ammunition, camp equipage, and stores. Horse artillery was brought into the service of this country by the duke of Richmond in the year 1792. There is a colonel-commandant, two colonels en second, four lieutenant-colonels, and one major, attached to it. The movements of horse artillery are made with great celerity, and it has been found, that they are perfectly adapted to act with cavalry in the field, in their most rapid movements, and are considered as forming an essential addition to the artillery service.

The royal artillery drivers are a corps first formed about twelve years ago, by the duke of Richmond. Previous to the corps being established, the horses and drivers were provided by contract; but, as no reliance could be placed on the service of either men or horses so procured, it was found absolutely necessary to abolish so unmilitary and destructive a plan; and to employ able men well trained to the service. The artillery horses are now kept in the highest condition, the drivers being thoroughly drilled to the manœuvres of artillery, and capable of securing, by rapid movements, advantageous positions in the field. This change arises from the high state of excellence in which the brigades are equipped, and from the artillery men being, in particular cases, mounted upon the cars attending the brigades.

A park of artillery is a sort of movable supernumerary detachment, containing not only light guns, to replace such as may be lost or taken, but 12-pounders, or 18-pounders, with 8 inch howitzers, for the purpose of defending important positions, entrenched posts, &c. breaking down bridges, and conducting sieges. Attached to it also are the reserve officers and men of this service. In expedition service, where disembarkations of artillery take place, the dépôt of reserve carriages, ammunition and stores, is usually formed near to the spot where the articles are landed from the ships, and a communication is kept up between the advanced park and the dépôt, from whence the articles are forwarded as demanded for the immediate exigencies of the park. See CANNON AND FORTIFICATION.

Regiments of artillery are always encamped, half on the right and half on the left of the park. The company of bombardiers (when they are formed into companies, which is the case in almost every nation except England) always takes the right of the whole, and the lieutenant colonel's company the left; next to the bombardiers, the colonels, the majors, &c. so that the two youngest are next but one to the centre of park; the two companies next to the park are the miners on the right, and the artificers on the left. In the rear of, and thirty-six feet from, the park, are encamped the civil list, all in one line.

The following Tables exhibit the latest official regulations for the proportion and disposition of the ammunition attached to the field-pieces of our army.

TABLE I.
HEAVY 5½ INCH HOWITZER.

ARTISCUS; from *aprog*, bread; in medicine, denotes a troche, more particularly that prepared with vipers flesh mixed up with bread, to be used in the composition of Venice treacle.

ARTIST. See ART.

An ARTIST has more correctly been defined one who practises any of the liberal arts as a profession, in distinction from the artisan who mixes them with trade and commerce. The builder, it is said, should not be called an architect, nor should the sign-painter, the figure-caster, or plasterer, the chair-sculptor, commonly called cabinet-maker, the paper-hanger, or wall-decorator, be called artists, because their employments do not consist in the exercise of the higher faculties of the mind, but in practising lower departments of art, or in executing the thoughts and designs of others. We are told of a privilege granted at Vicenza to artists, something like the benefit of clergy in England, in virtue whereof a criminal adjudged to death saves his life if he can prove himself the most consummate workman in any useful art. This plea is allowed them, in favorem artis, for the first offence; except in some particular crimes, of which coining is one; for here the greater the artist the more dangerous the person.

ARTIZOOS; from *apri* short, and *ζωη*, life; is used by some ancient physicians for an infant short-lived by reason of a difficult birth.

ARTOBRIGA, an ancient town of Vindelicia, now called Altzburg, in Bavaria, on the Danube, below Ingolstadt, according to Aventinus; but Cluverius supposes it to be Labenau on the Saltzbach, below Laufsen, in the archbishopric of Salzburg.

ARTOCARPUS; from *aprog*, bread, and *καρπος*, fruit; the bread-fruit tree; a genus of the monandria order and monœcia class; natural order, urticae. It has a cylindric amentum, thickens gradually, and is covered with flowers: the male and female in a different amentum. In the male, cal. none; cor. bivalved. In the female no calyx nor corolla; stylus, one, and the drupa is many celled. The species are, artocarpus incisa, sitodium incisum, radermachia incisa, soccus lanosus, seu granosus, in French le rima, ou fruit à pain, bread-fruit tree, native of the Molucca Islands. Artocarpus integrifolia, sitodium macrocarpon, seu cauliflorum, radermachia integra, soccus arboreus, seu tojacca-marum Indica, Indian jaca tree, a shrub, native of the East Indies. Artocarpus Philippensis, a shrub, native of the Phillipine Islands. Artocarpus pubescens, ansjeli, seu castania malabarica, a shrub, native of Malabar. Though this tree has been mentioned by many voyagers, particularly by Dampier, Rumphius, and Lord Anson, yet very little notice seems to have been taken of it till the return of Captain Wallis from the South Seas. Dampier states that in Guam, one of the Ladrone islands, 'there is a certain fruit called the bread-fruit, growing on a tree as big as our large apple-trees, with dark leaves. It is round, and grows on the boughs like apples, of the bigness of a good penny loaf: when ripe it turns yellow, soft, and sweet, but the natives take it green, and bake it in an oven till the rind is black; this they scrape off and eat the inside,

which is soft and white, like the inside of new-baked bread, having neither seed nor stone; but if kept above twenty-four hours it is harsh. As this fruit is in season eight months in the year, the natives feed upon no other sort of bread during that time.' Rumphius says, 'the fruit is shaped like a heart, and increases to the size of a child's head. Its surface or rind is thick, green, and covered everywhere with warts of a quadrigonal or hexagonal figure, like cut diamonds, but without points. The more flat and smooth these warts are the fewer seeds are contained in the fruit, and the greater is the quantity of pith, and that of a more glutinous nature. The internal part of the rind, or peel, consists of a fleshy substance, full of twisted fibres, which have the appearance of fine wool; these adhere to and in some measure form it. The fleshy part becomes softer towards the middle, where there is a small cavity formed without any nuts or seeds, except in one species which has but a small number, and this sort is not good unless it is baked or prepared some other way; but if the outward rind be taken off, and the fibrous flesh dried and afterwards boiled with meat as we do cabbage, it has the taste of artichoke bottoms. The inhabitants of Amboyna dress it in the liquor of cocoa-nuts, but they prefer it roasted on coals till the outward part or peel is burnt. They afterwards cut it into pieces and eat it with the milk of the cocoa-nut. Some people make fritters of it, or fry it in oil; and others, as the Sumatrans, dry the internal soft part, and keep it to use, instead of bread, with other food. It affords a great deal of nourishment, and is very satisfying, therefore proper for hard-working people; and being of a gentle astringent quality is good for persons of a laxative habit of body. It is more nourishing boiled in our manner with fat meat, than roasted on coals. The milky juice which distils from the trunk, boiled with the cocoa-nut oil, makes a very strong bird-lime. This tree is to be found on the eastern parts of Sumatra, and in the Malay language is called soccus and soccum capas. It grows likewise about the town of Bantam in Java, and in Balega and Madura.'

In 1791 a vessel was fitted out for the purpose of conveying a quantity of these inestimable trees to various parts of his majesty's colonies, under the command of Captain Bligh, who set sail on the 2d of August, and arrived at Otaheite April 8, 1792. The number of plants taken on board at Otaheite was 2634, in 1281 pots, tubs, and cases; and of these 1151 were bread-fruit trees. When they arrived at Coupang 200 plants were dead; but the rest were in good order. They arrived at St. Helena with 830 fine bread-fruit trees, besides other plants. Here they left some of them, and from hence the East Indies may be supplied with them. On their arrival at St. Vincent's they had 678 bread-fruit trees. Nearly half this cargo was deposited here for the use of the Windward Islands; and the remainder, intended for the Leeward Islands, was conveyed to Jamaica, and distributed as the governor and council of Jamaica pleased to direct. The exact number of bread-fruit trees brought to Jamaica was 352, out of which five only were

reserved for the botanic garden at Kew. There is a distinction between that which bears fruit with stones or seeds, and that in which the fruit has none. The parts of fructification of that tree which bears the fruit without stones are defective. The amentum, or catkin, which contains the male parts, never expands. The styli, or female parts of the fruit, are likewise deficient: from which it follows that there can be no stones or seeds, and therefore this tree can only be propagated by suckers or layers; although it is abundantly evident that it must originally have proceeded from the seed-bearing bread-fruit tree. Instances of this kind we sometimes find in European fruit, such as the barberry and the Corinthian grape from Zant, commonly called currants, which can therefore be increased only by layers and cuttings. Dr. Solander was assured by the oldest inhabitants of Otaheite, and the adjoining islands, that they well remembered there was formerly plenty of the seed-bearing bread-fruit; but they had been neglected on account of the preference given to the bread-fruit without seed, which they propagate by suckers.

ARTOIS, a ci-devant province of France, extremely fertile, and formerly one of the seventeen provinces of the Netherlands. The name was derived from the Atrebates, ancient inhabitants. Its greatest length from north to south was about twenty-four leagues, and its breadth about twelve, being bounded on the south and west by Picardy; on the east by Hainault; and on the north by Flanders. It is now included in the department of the Straits of Calais. Artois was always accounted a very productive province. It is rich in corn and hops, but is deficient in wood, and yields little wine or fruit. The chief articles of export are grain, flax, hops, wool, oil, cabbage, and rape-seed.

ARTOMELI; from *αρτος*, bread, and *μελι*, honey; in ancient pharmacy, a kind of cataplasma, prepared of bread and honey.

AKTOTYRITES; from *ἀρτος* and *τυρος*, cheese; a branch of the ancient Montanists, who first appeared in the second century in Galatia. They used bread and cheese in the Eucharist, or perhaps bread baked with cheese. Their reason was, that the first men offered to God not only the fruits of the earth, but of their flocks too. The artotyrites admitted women to the priesthood, and even to be bishops; and Epiphanius informs us, that it was a common thing to see seven girls at once enter into their church robed in white, and holding torches in their hands; where they wept and bewailed the wretchedness of human nature, and the miseries of this life.

ARTZEN, a market-town and bailiwick of Calenberg, in the principality of Hanover, between the Homme and Weser. To the bailiwick belong twenty-two villages and the castle of Furstenberg, formerly the property of the count of Oberstein. This town is the seat of an ecclesiastical superintendent.

ARVAD, or ARADUS, an ancient city of Phœnicia, built on a small island, south of Tyre, about three miles from the continent. It was formerly famous for commerce and riches, and shared the fate of Tyre. It is now called Ruwadde, and belongs to the Turks. It is quite ruinous, having only an old fort and a few can-

non to defend it; but the height of the island gives it a fine appearance from a distance.

ARVAL, a town of Hindostan, in the district and province of Bahar, forty miles south-west of Patna.

ARVALES FRATRES, in Roman antiquity, a college of twelve priests, instituted by Romulus, and chosen out of the most noble families, himself being one of the body: they assisted in the sacrifices of the ambervalia, annually offered to Ceres and Bacchus for the prosperity of the fruits of the earth, when they wore on their heads crowns made of ears of corn. The origin of this institution was as follows: Acca Laurentia, Romulus' nurse, was accustomed once a year to make a solemn sacrifice for a blessing on the fields, her twelve sons always assisting her in the solemnity; but at last losing one of them, Romulus offered himself to supply his place, and gave this small society the name of Arvales fratres. This order was in great repute at Rome; they held the dignity for life, and never lost it on account of imprisonment or banishment.

ARUANUS, in conchology, a species of murix, found on the coast of New Guinea. The tail is patulous; the spire crowned with spines. This is the buccinum aruanum of Rumphius.

ARVENSIUS, in entomology, a species of curculio; gray, with three lines on the thorax; the wing-cases rufous, and tessalated. Also a species of cicada, a native of Denmark: yellow; abdomen and sides black. A species of phalæna; the phalæna noctua of Linnæus. The wings are brown, with a transverse yellow spot in the middle; margin brown. This is the noctua brunnea of Schmetterl. Also a species of Vespa, found in Europe, with four yellow bands on the abdomen.

ARVERNI, a brave and ancient people; one of the most powerful nations of Gaul. They claimed affinity with the Romans, as descendants from Antenor; and after their subjugation by the latter, their ancient liberty was preserved to them on account of their bravery.

ARVICOLA, in entomology, a species of scarabæus, found in Russia: the shield of the head reflected; the body black.

ARVIRAGUS, the son of Cunobelin, a British king, in the time of Claudius and Domitian.

ARUM, or WAKE-ROBIN, in botany, a genus of plants of the class monocælia; order, polyandria. There are several species, of which the following are the most remarkable. The generic characters are CAL. spathe, one-leaved: cor. none: STAM. filaments, none; anthers, sessile: PIST. germ, obovate; style, none; stigma, bearded: PER. berry, globular; seeds, several. A. arborescens, or dumb cane, is a native of the sugar islands and warm parts of America, where it grows chiefly on low grounds. A. arisarium as well as the A. proboscidium and A. tenuifolium have usually been separated from this genus, and distinguished by the general name of arilarum, or friar's cowl: the flower bears in April. A. colocasia, as well as the A. divaricatum, esculentum, peregrinum, and sagittifolium, have all mild roots, which are eaten by the inhabitants of hot countries, where they grow naturally. A. dracunculus, or the common dragon's cane, grows naturally in most of the southern parts of Europe. A. italicum, a native of Italy, Spain,

~~and Portugal~~: they appear in the end of April or beginning of May. A. maculatum, or common wake-robin, grows naturally in woods and on shady banks in most parts of Britain: the flowers appear in April, and their structure has given rise to many disputes among the botanists. The receptacle is long, in the shape of a club, with the seed-buds surrounding its base. The chives are fixed to the receptacle amongst the seed-buds fixed to the fruit-stalk, and placed between two rows of tendrils, the use of which is not known. A. trilobatum, or arum of Ceylon, is a native of that island and some other parts of India. All the species of this plant are hardy, except the trilobatum and the arborescens. The former must be kept constantly in a stove, and the latter in a moderate hot-bed. The arborescens is propagated by cutting off the stalks into lengths of three or four joints, which must be left to dry six weeks or two months; for if the wounded part is not perfectly healed over before the cuttings are planted, they will rot and decay. They are then to be planted in small pots filled with light sandy earth, and plunged in a moderate hot-bed of tan, observing to let them have little water till they have taken good root. The roots of the maculatum and dracunculus are used in medicine, and differ in nothing but that the latter is somewhat stronger than the former. All the parts of the arum, particularly the root, have an extremely pungent acrimonious taste; but if dried and kept some time, it loses much of its acrimony, and becomes at length an almost insipid, farinaceous substance. This root is a powerful stimulant and attenuant. It is reckoned a medicine of great efficacy in some cachectic and chlorotic cases, in weakness of the stomach occasioned by a load of viscid phlegm. Great benefit has been obtained from it in rheumatic pains, in which it may be given from ten grains to a scruple of the fresh root twice or thrice a-day, made into a bolus or emulsion with unctuous and mucilaginous substances, which cover its pungency, and prevent its making any painful impression on the tongue. It generally excites a slight tingling sensation through the whole habit, and when the patient is kept warm in bed, produces a copious sweat. The arum was formerly an ingredient in an officinal preparation, the compound powder; but in that form its virtues are very precarious. Some recommend a tincture of it drawn with wine; but neither wine, water nor spirits, extract its virtues.

ARUNCI, in entomology, a species of *Cicada* of a ferruginous color and brown eyes.

ARUNCO, in zoology, a species of *rana*, or toad, larger than the common frog, but of the same color. It is found in Chili. All the feet are palmated.

ARUNCUS, GREATER MEADOW-SWEET, in botany, a genus of plants, called by Tournefort and others *barra capre*, and by Linnaeus *spiraea*. This plant has been supposed to be of the same genus with the *filipendula*, but, by the examination of the flowers, they appear to be extremely different.

ARUNDA, a town of Hispania Baetica, on the *Annas*, or *Guadiana*, now said to be Ronda in Granada, on the confines of Andalusia. Long. $5^{\circ} 40' W.$, lat. $36^{\circ} 26' N.$

ARUNDEL, an ancient borough and market town of Sussex, seated on the north-west side of the Arun, over which there is a bridge. It had a harbour in which a ship of 100 tons' burthen might ride; but the sea had ruined it so far, that in 1733 an act passed for repairing it, and for erecting new piers, locks, &c. The river is now navigable for vessels of 200 tons and upwards; and the navigation is carried on to the Thames by means of a canal. It abounds in mullet of a very fine quality. A considerable trade in bark is carried on here. Arundel is a borough by prescription, and has sent two members to parliament from the time of Edward I. It is mentioned in the will of Alfred, who left the castle to his brother's son. It was formerly a place of great strength, and was besieged by Henry I. in person, by whom it was taken after a gallant resistance from Bellesone de Montgomery earl of Arundel. The castle, which belonged to the family of Howard, was until lately in a mouldering condition; but completely repaired by the late Duke of Norfolk, at a great expense. A weekly market is held here on Thursday. Population 2700. Arundel is the premier earldom in England, belonging to the illustrious family of Norfolk; and is the only title in England that goes ~~with~~ with the lands. It is fifty-seven miles south-west by south of London, and ten east of Chichester.

ARUNDEL OIL, in the *materia medica*. At Bombay, Gamroon, and Surat in the East Indies, there grows a tree which bears a nut en closed in a rough husk, resembling the horse chestnut; and the kernel of the nut yields an oil by expression, which is of a purgative nature. A tea-spoonful of it is reckoned a dose. The tree is called, the Arundel tree at Bombay and its oil the Arundel oil. Dr. Monro thinks it probable that this is the oil of the purging nuts mentioned in Dale's *pharmacologia*, and the *palma Christi Indica* of Tournefort.

ARUNDEL (Thomas), archbishop of Canterbury in the reigns of Richard II. Henry IV. and Henry V., the second son of Robert, and brother of Richard earl of Arundel, who was beheaded. In 1375, at twenty-two years of age, from being archdeacon of Taunton he was raised to the bishopric of Ely. He was a great benefactor to the church and palace of this see. In 1386 he was appointed lord chancellor of England, and in 1388 translated to the archiepiscopal see of York; and in 1396 to that of Canterbury, when he resigned the chancellorship. This was the first instance of the translation of an archbishop of York to the see of Canterbury. Scarcely was he fixed in this see, when he had a contest with the university of Oxford about the right of visitation. The affair was referred to king Richard, who determined it in favor of the archbishop. At his visitation in London he revived an old constitution, by which the inhabitants of the respective parishes were obliged to pay to their rector one half-penny in the pound out of the rent of their houses. In 1398 the house of commons impeached him, together with his brother the Earl of Arundel, and the Duke of Gloucester, of high treason. The archbishop was sentenced to be banished, and within forty days to depart the kingdom on pain of death. He

retired first to France; and then to the court of Rome, where Pope Boniface IX. gave him a kind reception. About this time the duke of Lancaster, afterwards Henry IV. was in France, having also been banished by king Richard. The nobility and others, tired with the oppressions of Richard, solicited the duke to take the crown; sending over their request in a letter to archbishop Arundel, desiring him to be their advocate on this occasion with the duke. The archbishop accordingly accompanied the messengers to the duke at Paris, and of course the inviting offer, after some objections easily obviated, the duke accepted. Arundel returned with him to England, and was restored to his see. In the first year of this prince's reign, the archbishop summoned a synod which sat at St. Paul's. The next year we find him again in dispute with the commons, who moved that the revenues of the church might be applied to the service of the public: but Arundel opposed the motion with such vigor that it was negatived. In 1408 Arundel began to exert himself against the Lollards, or Wycliffites, particularly against the celebrated Sir John Oldcastle, Lord Cobham. He also procured a synodical constitution, which forbade the translation of the Scriptures into the vulgar tongue. He died at Canterbury in 1413, of an inflammation in his throat, with which he was first seized, it is said, whilst pronouncing sentence upon Lord Cobham. The Lollards asserted this to be a judgment from God; and Bishop Goodwin speaks in the same manner. 'He who had withheld,' says he, 'from the people the word of God, the food of the soul, by the just judgment of God had his throat so closed, that he could not speak a single word, nor swallow meat or drink, and was so starved to death.' He was buried in the cathedral church of Canterbury, under a monument erected by himself. To this church he was a considerable benefactor: he built the lantern, tower, and a great part of the nave; gave a ring of five bells, called from him Arundel's ring, several rich vestments, a mitre engraved with jewels, a silver gilt crosier, and two gold chalices.

ARUNDEL (Lady Blanch), daughter of the earl of Worcester, and wife of Lord Arundel, celebrated for her brave defence of Wardour castle against the parliamentary army, which consisted of 1300 men; and although the little garrison mustered only forty-five, yet she maintained the place for six days, and then capitulated. She died in 1649, aged sixty-six.

THE ARUNDELIAN MARBLES, are ancient stones or marbles, first named after Thomas earl of Arundel, who procured them from the east, or from Henry his grandson, who presented them to the university of Oxford. They arrived in England in 1627, and then consisted of thirty-seven statues, 128 busts, and 250 inscriptions, together with a large number of altars, sarcophagi, fragments of sculpture, and an invaluable assemblage of gems; the inscriptions being principally sepulchral, and of a private nature. But one, called the Parian chronicle, from its being written at Paros, is said to have contained a chronological detail of the principal events of Greece, during a period of 1318 years, beginning with

Cecrops, before Christ 1582 years, and ending with the archonship of Diognetus, before Christ 264. It is this portion of these marbles which more particularly attracted the attention of the learned. The chronicle of the last ninety years is lost; so that the part now remaining ends at the archonship of Diotimus, 354 years before the birth of Christ; and in this fragment the inscription is at present much corroded and effaced.

The whole of these relics of antiquity, real or pretended, were purchased in Asia Minor, or in the islands of the Archipelago, by Mr. William Petty, who in the year 1624 was sent by the earl of Arundel for the purpose of making such collections for him in the east; and when brought to England were placed in gardens belonging to Arundel house. Soon after their arrival they excited general curiosity, and were inspected by Sir Robert Cotton, and other eminent men, who prevailed upon the learned Selden to employ himself in explaining the inscriptions. The following year Selden accordingly published a small volume in quarto, including about thirty-nine of them. But in the turbulent reign of Charles I. and the subsequent usurpation, Arundel-house was often deserted by the illustrious owners; and in their absence, many of these marbles were defaced and mutilated, and others either stolen or used for the ordinary purposes of architecture. The Parian chronicle in particular, was unfortunately broken. The upper part containing thirty-one epochas, is said to have been worked up in repairing a chimney in Arundel-house. Selden's work becoming very scarce, bishop Fell engaged Mr. Prideaux to publish a new edition of the inscriptions, which was printed at Oxford in 1676. In 1732, Mr. Maittaire obliged the public with a more comprehensive view of the marbles than either of his predecessors. Lastly, Dr. Chandler published a new and splendid description of them in 1763, in which he corrected many mistakes of the former editors; and in some of the inscriptions, particularly that of the Parian chronicle, supplied the lacuna by many ingenious conjectures. We cannot here enter into the dispute respecting the authenticity of these curious stones. Sir Isaac Newton and other able chronologists and historians have paid little regard to their claims; and in 1788, a Mr. Robertson, in an essay, entitled the Parian Chronicle, boldly, and with much plausibility, asserts them to be a fabrication of comparatively modern date. This treatise was reviewed by the late professor Porson, in the Monthly Review, June 1789; that distinguished Greek scholar fully and very ably vindicating the authenticity of the Parian marbles. See also his Tracts, edited by Mr. Kidd. p. 57. The reader will thus be sufficiently acquainted with both sides of this subject.

ARUNDINACEA, in conchology, a species of sabella found in some rivers of Europe. It is subconic, and composed of fragments of the bark of reeds placed on each other.

ARUNDINACEUS, in ornithology, a species of turdus or thrush, that inhabits the reedy marshes of Europe, and is the la rousserolle of Buffon and Brisson; the junco of Ray and Willoughby; and the reed thrush of Dr. Latham. It

is rather larger than the common lark; of a ferruginous brown color; quill-feathers brown, reddish at the end. It is found in Russia and Poland.

ARUNDINETI, in entomology, a species of *tipula*; color whitish, with villose antennae, and black eyes. It is found in Europe, in reedy marshes.

ARUNDINIS, a species of *phalæna*, living on reeds; wings cinereous with black dots, marked beneath with a central brown spot. Also a species of *aphis* that lives on the leaves of the wood-reed. The body is green; thorax and head brown.

ARUNDO, in botany, the reed: a genus of the digynia order, triandria class of plants; ranking in the natural method under the fourth order, graminea. The calyx consists of two valves, and the floscules are thick and downy. The following are the principal species, viz. 1. *A. arborea*, has a tree-like stalk, with narrow leaves, and in all other respects resembles the bambos. 2. *A. bambos*, or the bamboo, is a native of the East Indies and some parts of America; where it frequently attains the height of sixty feet. See BAMBOO. 3. *A. debax*, or manured reed, a native of warm countries, but will bear the cold of our moderate winters in the open air. It dies to the surface in autumn, but appears again in the spring ten or twelve feet high in one summer. The stalks of this species are brought from Spain and Portugal; and used by weavers, as also for making fishing-rods. 4. *A. orientalis* is what the Turks use for writing pens: it grows in a valley near mount Athos, as also on the banks of the river Jordan. None of these plants are found in Britain. 5. *A. phragmitis*, or the common marsh-reed, grows by the sides of our rivers, and in standing waters. 6. *A. versicolor*, the Indian variegated reed, supposed to be a variety of the debax, differing from it only in having variegated leaves.

ARUNS TARQUINIUS, the son of Tarquin II., the last king of Rome, who meeting Brutus in the first battle, after the banishment of the royal family, they mutually killed each other.

ARURA, in the middle-age writers, a field ploughed and sowed. Some writers also use the word to signify the work of a day at plough.

ARUSINI CAMPi, or ARUSIAN FIELDS, plains in Lucania, famous for the last battle between the Romans and Pyrrhus. That prince being at Tarentum, and hearing that the two new consuls Curius Dentatus and Cornelius Lentulus had divided their forces, the one including Lucania and the other Samnium; he divided a chosen detachment of his army into two bodies, marching with his Epirots against Dentatus, in hopes of surprising him in his camp near Beneventum. But the consul having notice of his approach, marched out of his entrenchments with a strong detachment of legionaries to meet him, repulsed his van guard, put many of the Epirots to the sword, and took some of their elephants. Curius, encouraged by this success, marched into the Arusian fields, and drew up his army in a plain, which was wide enough for his troops, but too narrow for the Epirot phalanx to act. But the king's eagerness to try his strength and skill with

so renowned a commander, stimulated him to engage at that great disadvantage. Upon the first signal the action began; and one of the king's wings giving way, victory seemed inclined to the Romans. But that wing where the king fought in person repulsed the enemy, and drove them to their entrenchments. This advantage was in great part owing to the elephants; a circumstance which Curius perceiving, commanded a body of reserve, which he had posted near the camp, to advance and attack those animals with burning torches; which frightened and annoyed them to such a degree, that they wheeled about, broke into the phalanx, and put that body into the utmost disorder. The Romans taking advantage of this confusion, charged with such fury that the enemy were entirely broken and defeated. Pyrrhus retired to Tarentum, attended only by a small body of horse, leaving the Romans in full possession of his camp; which they so much admired, that they ever after imitated it as a model.

ARUS'PEX, Lat. *aruspex*, or *haruspex*, ARUS'PICE, } from *ara*, an altar, and *spicere*, ARUS'PICY. } to see, to regard.

Adorn'd with bridal pomp, she sits in state;
The public notaries and *aruspex* wait.

Dryden's Juvenal's Satires, 10.

They [the ~~shamans~~] had colleges for augurs and *aruspices*, who used to make their predictions, sometimes by fire, sometimes by flying of fowls, &c.

Howell's Letters, iii. p. 23.

A flam more senseless than the roguery
Of old *aruspicy* and augury.

Butler's Hudibras, ii. 3.

ARUSPICES, or HARUSPICES, in Roman antiquity, an order of priests who pretended to foretell future events by inspecting the entrails of victims killed in sacrifice; they were also consulted on occasion of portents and prodigies. The aruspices were always chosen from the best families; and as their employment was of the same nature as that of the augurs, they were as much honored. Their college, as well as those of the other religious orders, had its particular registers and records. Cato, who was an augur, used to say, he wondered how one *aruspex* could look at another without laughing in his face. The *aruspici libri*, were a kind of sacred writings wherein the laws and discipline of the aruspices were described.

ARVUM, in ancient agriculture, properly denoted ground ploughed but not sowed. The word is sometimes extended to all arable, or corn land, in contradistinction from pasture.

ARX, in the ancient military art, a town, fort, or castle, for defence of a place. The *arx*, in ancient Rome, was a distinct edifice from the capitol, though some have confounded the two. The *arx*, properly speaking, being a place on the highest part of the Capitoline Mount, fortified with towers and pinnated walls, in which was also the temple of Jupiter Capitolinus. This was also the name of a consecrated place on the Palatine Mount, where the augurs publicly performed their office. Off this *arx* the *feciales*, or heralds, gathered the grass used in the ceremony of leagues and treaties.

ARYTENOIDES, in anatomy, two cartilages which, with others, constitute the head of the

Jarynx. It is also applied to some muscles of the larynx.

ARYTENOIDEUS, in anatomy, one of the muscles serving to close the larynx.

ARYTHMUS, in medicine, the want of a just modulation in the pulse. It is opposed to eu-rythmus, a pulse modulated agreeably to nature.

ARZBERG, a market town in the circle of the Maine, district of Wunsiedel, Bavaria. The neighbouring hills yield iron, lime, and alum. The lime burned here is transported as manure to the Upper Palatinate and Bohemia. Seven miles east of Wunsiedel.

ARZILLA, an ancient maritime town of Africa, in the kingdom of Fez, S. S. W. of Tangiers. It was formerly a Roman colony; afterwards fell under the government of the Goths, and was next taken by the Mahomedans. Alphonso of Portugal, surnamed the African, took it by assault in 1472, and brought away the presumptive heir of the crown. After that prince came to the throne, he besieged it, in 1508, with 100,000 men. The Portuguese at length forsook it of their own accord. Long. $5^{\circ} 40' W.$, lat. $35^{\circ} 40' N.$

AS. Usually called a conjunction, but according to some the Saxon article, *the, this or that*, which they say may always be substituted for it.

Besides that law which concerneth men *as* men; and that which belongs unto men *as* they are men, linked with others in some society: there is a third, which touches all several bodies politick, so far forth, *as* one of them hath publick concerns with another.

Hooker's Eccles. Polity.

PRINCE HEN. Dar'st thou be *as* good as thy word now?

FALST. Why, Hal, thou knowest, *as* thou art but a man, I dare; but *as* thou art a prince, I fear thee, *as* I fear the roaring of the lion's whelp.

Shakespeare. Henry IV.

When thou dost hear I am *as* I have been; Approach me, and thou shalt be *as* thou wast. *Id.*

The cunningest mariners were so conquered by the storm, *as* they thought it best, with stricken sails, to yield to be governed by it. *Sidney.*

He had such a dexterous proclivity, *as* his teachers were fain to restrain his forwardness. *Wotton.*

The relations are *so* uncertain, *as* they require a great deal of examination. *Bacon.*

God shall by grace prevent sin so soon, *as* to keep the soul in the virginity of its first innocence. *South.*

Madam, were I *as* you, I'd take her counsel; I'd speak my own distress. *Philip's Distrest Mother.*

The objections that are raised against it *as* a tragedy, are as follow.

Gay's Preface to What d'ye Call it.

A simple idea is one uniform idea; *as* sweet, bitter. *Watts.*

As, among the ancient Romans, a weight, consisting of twelve ounces; being the same with libra, or the Roman pound. The word is derived from the Greek *aig*, which in the Doric dialect is used for *aq*, one, q. d. an entire thing; though others will have it named as, *quasi as*, because made of brass.

As, was also the name of a Roman coin, of different weight and different matter in different ages of the commonwealth. Under Numa Pompilius, according to Eusebius, the Roman money

was either of wood, leather, or shells. In the time of Tullus Hostilius, it was of brass; and called as, libra, libella, or pondo, because actually weighing a pound or twelve ounces. About 420 years after, the first Punic war having exhausted the treasury, they reduced the as to two ounces. In the second Punic war, Hannibal pressing very hard upon them, they reduced the as to half its weight, viz. to one ounce. And lastly, by the Papirian law, they took away half an ounce more, and consequently reduced the as to the diminutive weight of half an ounce; and it is generally thought that it continued the same during the commonwealth, and even till the reign of Vespasian. The as, therefore, was of four different weights in the commonwealth. Its original stamp was that of a sheep, ox, or sow; but from the time of the emperors, it had on one side a Janus with two faces, and on the reverse the rostrum or prow of a ship.

As, being used to denote any integer or whole, signified in old English law the whole inheritance; whence *haeres ex asse*, the heir to the whole estate.

ASA; אָסָה, Heb. i. e. a healer of sickness; king of Judah, succeeded his father Abijam, A. M. 2988. He abolished idolatry, restored the worship of the true God, and, with the assistance of Benhadad king of Syria, took several towns from the king of Israel. He died A. A. C. 917, and was succeeded by Jehoshaphat.

ASA, among naturalists, a word taken by modern authors from the lasar of the ancients, is applied to a gum very different from that anciently known by the name. The asa of the ancients was an odoriferous and fragrant gum; that of after ages had so little title to this epithet, that they distinguished it by an additional one, expressing its being of an offensive smell, as *ASAFETIDA*, which see. The Arabian writers describe two kinds of asa, the one of an offensive, the other of an aromatic smell.

ASA, or **Assa**, in the *materia medica*, a name given to two very different substances, called *asa dulcis* and *asa foetida*.

ASAFETIDA, in chemistry, the common name of the *FERULA asafetida* of Linnæus, which see.

ASAHEL; אַשְׁאֵל, Heb. i. e. God has wrought; one of the sons of Zeruiah, David's sister, and the younger brother of Joab. He was one of David's thirty heroes, and remarkable for his swiftness. At the battle of Gibeon he pursued Abner with so much obstinacy, that he was obliged to kill him in self-defence, though it would appear with reluctance; 2 Sam. iii. 19-23.

ASAPH; אַסְפָּה, Heb. i. e. gathering; the son of Berachiah, a Gershonite, and a famous musician and psalmist under David, king of Israel. Twelve of the Psalms bear his name; but it is doubted whether he was the author of them all, as some relate to later times.

ASAPH, Sr. a city of Flintshire, in North Wales, situated in a pleasant valley at the confluence of the Elwy and Clwyd, twenty miles west of Chester, and 205 north-west of London.

As a bishopric, St. Asaph is of great antiquity, being founded about A. D. 560, by Kentigern, bishop of Glasgow. He began the church on the banks of the river Elwy, whence it is called by the Welsh, Land Elwy, and in Latin, Elvensis. Kentigern returning into Scotland left St. Asaph his successor. The country was frequently in after times the seat of war between the English and the Welsh; and the records of the see are therefore very defective. This diocese does not contain any one whole county, but consists of part of Denbigh, Flint, Montgomery, and Merioneth shires, and a small part of Shropshire; wherein are 121 parishes, and 131 churches and chapels, most of which are in the immediate patronage of the bishop. It has but one archdeaconry, viz. that of St. Asaph, which is united to the bishopric, for the better maintenance thereof. The town, although situated in a rich valley, is a poor ill-built place; and the cathedral a plain building, 170 feet long, 108 broad, and 90 high; near it are the vestiges of a large Roman camp. Here is a bridge over the two rivers. Market on Saturday. The deanery of St. Asaph is valued at £45 11s. 5d. and is united to the vicarage of Henllan in the deanery of Ross.

ASAPH, St. a native of North Wales, was descended of an ancient family, and flourished under Carentius king of the Britons, about A. D. 590. Being a monk in the convent of Llan Elwy, and the successor of its founder Kentigern, that establishment received his name ever after. He wrote the Ordinances of his church, and the Life of St. Kentigern. Bayle says he was the first who received unction from the pope.

ASAPHEIS, ασαφεις; from α negative, and σαφης, clear; persons who do not utter their words in a clear manner. The defect is occasioned, says Galen, 'either by some hurt which the organs of speech have contracted from a disorder of the nerves, or else by delirium.'

ASAPPES, or AZAPES, an order of soldiers in the Turkish army, whom they expose to the first shock of the enemy. The word is derived from the Turkish saph, which signifies rank, from whence they have formed asphalt, to range in battle. They travel on foot, and have no pay but the plunder they can get from the enemy.

ASAR, a gold coin current at Ormus in the Persian Gulf, worth 6s. 8d.

ASAROTA, ασαρωτα; from α and σαρω, I sweep; a kind of painted pavement in use before the invention of Mosaic work. The most celebrated was that at Pergamos, painted by Jesus, and exhibiting the appearance of crumbs, as if the floor had not been swept after dinner; whence, according to Pliny, the denomination. Perrault supposes it to have been a black kind of pavement of a spongy matter.

ASARUM, ASARABACCA, in botany, a genus of the monogynia order, and dodecadria class of plants. The calyx is trifid or quadrifid, and rests on the germen; there is no corolla; the capsule is leathery and crowned. There are three species, viz. 1. A. Canadense, a native of Canada. 2. A. Europeum, growing naturally in some parts of England; and 3. A. Virgin-

cum, a native of America. The dried roots of this plant have been generally brought from the Levant; those of our own growth being supposed weaker. Both the roots and leaves have a nauseous, bitter, acrimonious, hot taste; their smell is strong, and not very disagreeable. The principal use of this plant among us is as a sternutatory; and the root of asarum is perhaps the strongest of all the vegetable errhines, white hellebore itself not excepted. The leaves are the principal ingredient in the pulvis sternutatorius, or pulvis asari compositus, of the shops.

ASASI, in botany, a name given by the people of Guinea to a tree, the leaves of which being boiled in water, and held to the mouth, cure the tooth-ache. In its form and manner of growing it resembles the laurel; the leaves are very hard and stiff, and grow alternately on the stalks; they have short pedicles, and the branches are blackish and rugged, but variegated with small reddish spangles, or scaly protuberances.

ASBAMEA, in ancient geography, a fountain of Cappadocia, near Tyana, sacred to Jupiter and to an oath. Though this fountain bubbled up as in a state of boiling, yet its water was cold; and never ran over, but fell back again.

ASBECK, a town of the bishopric of Munster, Westphalia, annexed to the possessions of the house of Salm in 1803. Here is a convent for noblemen's daughters. It is four miles south-east of Ahaus.

ASBEN, a considerable kingdom in the interior of Africa, between Fezzan and Cashna. The sultan is said by Horneemann to rank next to that of Bornou among the sovereigns of interior Africa. Zansara and Guber are tributaries to him; he resides at Agades, and himself, with the greater part of his subjects, are Tuaricks of the tribe Kolluvi.

ASBESTOS, or ASBESTUS, in chemistry, from α privative, and σβεννυμ, I extinguish; a mineral consisting principally of silex and magnesia, with a small proportion of alumina, lime, and iron. It is a greenish brittle substance, unctuous to the touch, and somewhat elastic. Its fibres exposed to the violent heat of the blow-pipe, exhibit slight indications of fusion; though the parts, instead of running together, moulder away, and part fall down, while the rest seem to disappear before the current of the air. Ignition impairs the flexibility of asbestos in a slight degree. According to Herodotus, the Egyptians made a cloth of this substance, which they used, for the purpose of wrapping up the bodies of the dead. Pliny says, he had seen napkins made of it, which, being taken foul from the table after a feast, were thrown into the fire, and by that means were better scoured than if they had been washed in water, &c. But he mentions its principal use being for the making of shrouds for royal funerals, so that the ashes might be preserved distinct from those of the wood, &c. whereof the funeral pile was composed. He calls the asbestos, inventu rarum, textu difficillimum. Bapt. Porta assures us, that in his time the spinning of asbestos was a thing known to every body at Venice; and Sig. Castagnatta, a superintendant of mines in Italy, is said

to have carried the manufacture to such perfection, that his asbestos was soft and tractable, much resembling lamb-skin dressed white: he could thicken and thin it at pleasure, and thus either make it into a very white skin or into paper. His method of preparing it is thus described: the stone is laid to soak in warm water; then opened and divided by the hands, that the earthy matter may be washed out. The ablation being several times repeated, the flax-like filaments are collected and dried; being most conveniently spun with an addition of flax. Two or three filaments of the asbestos are easily twisted along with the flaxen thread, if the operator's fingers are kept oiled. The cloth also, when woven, is best preserved by oil from breaking or wasting. On exposure to the fire the flax and the oil burn out, and the cloth remains pure and white. The shorter filaments which separate in washing the stone, may be made into paper in the common manner. Five varieties are described: 1. Common asbestos, which occurs in masses of fibres of a dull greenish color, and of a pearly lustre. It is scarcely flexible, and greatly denser than amianthus. Specific gravity, 2·7. Fuses with difficulty into a grayish-black scoria. It is composed of 63·9 silica, 16 magnesia, 12·8 lime, 6 oxide of iron, and 1·1 alumina. It is more abundant than amianthus, being usually found in serpentine, at Portsoy, the Isle of Anglesea, the Lizard in Cornwall, &c. It was found in the limestone of Glentilt, by Dr. M'Culloch in a pasty state, but it soon hardened by exposure to the air. 2. Amianthus, which occurs in very long, fine, flexible, elastic fibres, is of a white, greenish, or reddish color. It has a silky or pearly lustre, and is slightly translucent; sectile; tough; specific gravity, from 1 to 2·3; it melts with difficulty before the blow-pipe into a white enamel, and consists of 59 silex, 25 magnesia, 9·5 lime, 3 alumina, and 2·25 oxide of iron. It is usually found in serpentine, in Savoy; in long and beautiful fibres, in Corsica; near Bareges in the Pyrenees; in Dauphiny and St. Gothard; at St. Keverne, Cornwall; and at Portsoy, Scotland; in mica slate at Glenelg, Invernessshire, and near Durham. 3. Mountain leather, consisting not of parallel fibres, but interwoven and interlaced so as to become tough. When in very thin pieces it is called mountain paper. Its color is yellowish-white, and its touch meagre. It is found at Wanlockhead, in Lanarkshire. Its specific gravity uncertain. 4. Mountain cork, or elastic asbestos, is, like the preceding, of an interlaced fibrous texture; is opaque, has a meagre feel and appearance, not unlike common cork, and like it too, is somewhat elastic. It swims on water. Its colors are white, gray, and yellowish-brown. Receives an impression from the nail; very tough; cracks when handled, and melts with difficulty before the blow-pipe. Specific gravity, from 0·68 to 0·99. It is composed of silica 62, carbonate of lime 12, carbonate of magnesia 23, alumina 2·8, oxide of iron 3. 5. Mountain wood, or ligniform asbestos, is usually massive, of a brown color, and having the aspect of wood. Internal lustre, glimmering. Soft, sectile, and tough; opaque; feels meagre; fusible into a black slag. Specific

gravity 2·0. It is found in the Tyrol; in Dauphiny; and in Scotland: and has lately been employed by Aldini as a protecting dress for firemen.

ASCALON, an ancient city, one of the five satrapies or principalities of the Philistines; situated on the Mediterranean, forty-three miles south-west of Jerusalem, between Azotus on the north, and Gaza on the south. It was the birthplace of Herod the Great, thence surnamed Ascalonites, and was famous for its escallions, which take their name from this town. It is now called Scalona.

ASCANII, in entomology, a species of curculio, of shape cylindrical, color black, and bluish on the sides.

ASCANIUS, the son of Æneas and Creusa, succeeded his father in the kingdom of the Latins, and defeated Mezentius king of the Tuscans, who had refused to conclude a peace with him. He founded Alba Longa; and died about A. A. C. 1139, after reigning thirty-eight years.

ASCANIUS, in entomology, a species of papilio. Color black, above and beneath, with a white band; posterior wings reddish; it is a native of sil.

ASCARIS, *ασκαρίς*; from *ασκεω*, to move about; in zoology, an intestinal worm so called from its troublesome motion. In the Linnaean system it is a genus of the class vermes, order intestina; thus generically characterised. Body round, elastic, and tapering towards each extremity; head with three vesicles; tail obtuse or subulate; intestines spiral, milk-white, and pellucid. Upwards of eighty species have been enumerated, generally deriving their name from the animal they chiefly infest: for the intestinal canal of most animals is affected by some species.

The species of Ascaris described by Gmelin are arranged in the following order:

Infesting man, and the mammalia.—*Vermicularis, lumbrioides*;—*vespertilionis*, in the long-eared bat:—*Phoca, bifida, canis, visceralis, lupi, vulpis, leonis, tigridis, felis, cati, martis, bronchialis, renalis, mephitidis, gulonis, talpæ, muris, hirci, vituli, equi, suis, apri.*

Infesting birds.—*Aquila, albicillæ, buteonis, milvi, subbuteonis, hermaphrodita, cornicis, coracis, cygni, anatis, fuligulæ, lari, ciconiæ tardæ, papillosa, gallopavonis, galli, gallinæ, phasianis, tetraonis, columbæ, alaudæ, sturni, turdi.*

Infesting reptiles.—*Testudinis, lacertæ, bufoñis, pulmonalis, rubetra, trachealis, ranæ, intestinalis, dyspnœos, insons.*

Infesting fishes.—*Anguillæ, marina, blennii, rhombi, percæ, globicola, lacustris, siluri, farioñis, trutta, maraenæ, acus, halecis, argentinæ, gobiañis, rajæ, squali, lophii.*

Infesting worms.—*Lumbrici.*

We can only describe the two principally infesting man.

1. *A. lumbricoides*, is about the same length with the *lumbricus terrestris*, or common earth-worm; but it wants the protuberant ring towards the middle of the body, the only mark by which they can be properly distinguished. The body is cylindrical, and subulated at each extremity; but the tail is somewhat triangular. The *lumbricoides* is the worm which is most commonly

found in the human intestines. It is viviparous, and produces vast numbers. 2. A. vermicularis, with faint annular rugæ and the mouth transverse, is about a quarter of an inch long, and thicker at one end than the other. It is found in boggy places, in the roots of putrid plants, and very frequently in the rectum of children and horses. It emaciates children greatly, and is sometimes vomited up. See MEDICINE and WORMS.

ASCAROIDES, a species of cucullanus found in the stomach of the silurus glanis: the head is orbicular; tail round, short, and pointed with two spicules.

ASCEND'

ASCENDANT, n. & adj.

ASCENDANCY,

ASCENSION,

ASCENSIVE,

ASCENT.

Ascendo, from *ad*,

and *scendo*, to climb.

To mount upwards,

to mount, to rise, to

acquire an elevation,

a superiority.

Eneas and vnsilly Dido baith tuay,

To forest grathis in hunting forth he wend

To marrow als fast as Titan dois ascend,

And ouer the wORLD gan his bernes spred.

Douglas *Eneados*, bk. iv. p. 104.

Northumberland, thou ladder wherewithal
The mounting Bolingbroke ascends the throne.

Shakespeare. *Richard II.* act v. sc. 2.

Over head up grew

Insuperable height of loftiest shade,
Cedar and pine and fir and branching palm,
A sylvan scene ; and as the ranks ascend,
Shade above shade, a woody theatre
Of stateliest view.

Milton's *Paradise Lost*, book iv. line 131.

Then, rising from his grave,
Spoil'd principalities and pow'rs ; triumph'd,
In open shew ; and, with ascension bright,
Captivity led captive through the air.

Id.

Thus look'd Elisha, when to mount on high,
His master took the chariot of the sky ;
The fiery pomp, ascending, left the view ;
The prophet gazed, and wished to follow too.

Parnell.

In his blest life

I see the path, and in his death the price,
And in his great ascent, the proof supreme
Of immortality.

Young.

Themistocles now entered. At his look,
Which carried strange ascendancy, a spell
Controlling nature, was the youth abash'd.

Glover's *Athenaid*, book xiv.

Thus, having passed the rocks in safety, we found
the rest of the coast rise from the sea with a smooth
and easy ascent ; and, floating at ease upon a gentle
tide, we soon reached the sands with our feet.

Hawkesworth's *Telemachus*.

Their tribes adjusted, clean'd their vig'rous wings,
And many a circle, many a short essay,
Wheel'd round and round : in congregation full,
The figur'd flight ascends.

Thomson.

Fire fill'd his eyes ;

Turning, he bade the multitude without

Ascend the rampart ; they his voice obey'd,

Part climb'd the wall, part pour'd into the gate.

Cowper's *Iliad*, book xii.

ASCENDANT, in astrology, denotes the horoscope, or the degree of the ecliptic which rises upon the horizon at the time of the birth of any one. This is supposed to have an influence on

the person's life and fortune, by giving him a bent and propensity to one thing more than another. In the jargon of Astrologers, it is also called the first house, the angle of the east, or oriental angle, and the significator of life.—Such a planet ruled in his ascendant; Jupiter was in his ascendant, &c. Hence the word is also used in a moral sense, for a certain superiority which one man has over another from some unknown cause.

ASCENDANTS, in law, are opposed to descendants in succession; i. e. when a father succeeds his son, or an uncle his nephew, &c. heritage is said to ascend, or go to ascendants.

ASCENDING, in astronomy, is said of such stars as are rising above the horizon in any parallel of the equator. And thus likewise,

ASCENDING LATITUDE, is the latitude of a planet, when going towards the north pole.

ASCENDING NODE, is that point of a planet's orbit, wherein it passes the ecliptic, to proceed northward. This is otherwise called the northern node, and represented by this character Ω .

ASCENDING SIGNS, among astrologers, are those which are upon their ascent, or rise, from the nadir, or lowest part of the heavens, to the zenith, or highest.

ASCENDING VESSELS, in anatomy, those which carry the blood upwards ; as the aorta ascends. See ANATOMY.

ASCENSION, an island of the Atlantic, in S. lat. $8^{\circ} 8'$, and W. long. $14^{\circ} 28'$, lately taken possession of by Great Britain, with a view to the better defence of St. Helena. Prior to this it was wholly uninhabited. The island, which has an excellent harbour, is ten miles in length from north-west to south-east, and from five to six in breadth. A flag officer resides here, on the single spot which presents a vegetable mould, in the south-east corner of the island: and homeward bound vessels from the Cape of Good Hope and the East Indies call here, under certain regulations. Plenty of fish and sea-fowl are found on the shores, and some fine turtle. ASCENSION is evidently a volcanic production ; at a distance it has the appearance of an immense sugar-loaf arising out of the sea, but on approaching it the top is broken into various barren peaks.

ASCENSION, in astronomy, is either right or oblique. Right ascension of the sun, or a star, is that degree of the equinoctial, counted from Aries, which rises with the sun or star in a right sphere. Oblique ascension is an arch of the equator intercepted between the first point of Aries and that point of the equator which rises together with a star in an oblique sphere.

To find the right ascension of the sun, stars, &c. by trigonometry, say, as the radius is to the cosine of the sun's greatest declination, or obliquity of the ecliptic ; so is the tangent of the sun's or star's longitude to the tangent of the right ascension. To find the ascensional difference, you must have the latitude of the place, and the sun's declination given : then say, as the radius is to the tangent of the latitude ; so is the tangent of the sun's declination to the sine of the ascensional difference sought. This, converted into time, shows how much he rises before, or sets after, six o'clock ; by subtracting which from the right ascension, when the sun is

in the northern signs, and adding it when he is in the southern ones, you will find the oblique ascension.

ASCENSION DAY; the day on which the ascension of our Saviour is commemorated, commonly called Holy Thursday; the Thursday but one before Whitsuntide.

ASCENSIONAL DIFFERENCE, is the difference between the right and oblique ascension of the same point to the surface of the sphere. The ascensional difference of the sun, converted into time, is just so much as he rises before or after six o'clock.

ASCENSIONIS, in ichthyology, a species of perca, found about Ascension Island; color reddish above, whitish beneath, the tail bifurcated.

ASCENT, in logic, denotes a kind of argument, wherein we rise from particulars to universals: as, when we say, this man is an animal, and that man is an animal, and the other man, &c. therefore every man is an animal.

ASCENT, in physics, implies the motion of a body upwards, or the continual recess of a body from the earth. The Peripatetics attributed the spontaneous ascent of bodies to a principle of levity inherent in them. The moderns deny spontaneous levity; and show, that whatever ascends, does it in virtue of some external impulse or extrusion. Thus smoke and other rare bodies ascend in the atmosphere; and oil, light woods, &c. in water; not by any internal principle of levity, but by the superior gravity or tendency downwards of the parts of the medium where they are. The ascent of light bodies in heavy mediums is produced after the same manner as the ascent of the lighter scale of a balance. It is not that such scale has an internal principle whereby it immediately tends upwards; but it is impelled upwards by the preponderancy of the other scale; the excess of the weight of the one having the same effect, by augmenting its impetus downwards, as so much real levity in the other; because the tendencies mutually oppose each other, and that action and re-action are always equal.

ASCERTAIN', } Old Fr. *certener*, from

ASCERTAIN'MENT. } ad and *certum*, *cerno*; gr. *κρίνω*, to distinguish, to separate. To be sure or certain, to discover the truth, to bring inquiries to a satisfactory result.

The divine law both *ascertaineth* the truth, and *supplieth* unto us the want of other laws. *Hooker.*

Money differs from uncoined silver in this, that the quantity of silver in each piece is *ascertained* by the stamp. *Locke.*

Right judgment of myself may give me 'the other certainty; that is, *ascertain* me, that I am in the number of God's children.

Hammond's Practical Catechism.

This makes us act with a repose of mind, and wonderful tranquillity; because it *ascertains* us of the goodness of our work. *Dryden's Dufresnoy.*

He tells us that the positive *ascertainment* of its limits, and its security from invasion, were among the causes for which civil society itself has been instituted.

Burke on the Revolution in France.

The characters of great men, which are always mysterious while they live, are *ascertained* by the faithful historian, and sooner or later receive their wages of fame or infamy, according to their true deserts. *Couper's Letters.*

ASCESIS, from the verb *ασκεῖν*, used by the ancients in speaking of the sports and combats of the athlete, properly denotes exercise of the body. It is also used by philosophers, to denote an exercise conducive to virtue, or to the acquiring a greater degree of virtue. This is particularly denominated the philosophical ascesis, because practised chiefly by philosophers, who make a more peculiar profession of improving themselves in virtue; on the model of which the ancient Christians introduced a religious ascesis.

ASCETERIUM, in ecclesiastical writers, a monastery, or place set apart for the exercises of religion. The word is formed from *ascesis*, exercise; or *ascetra*, one who performs exercise. Originally it signified a place where the athlete or gladiators performed their exercise.

ASCETICK, n. & adj. } *Ασκετικός, ασκεώς*

ASCET'ICISM. } to exercise. Applied primarily to those who exercised themselves in religious contemplations and for this purpose separated themselves from the world.

None lived such long lives as monks and hermits; sequestered from plenty, to a constant *ascetick* course of the severest abstinence and devotion. *South.*

I am far from commanding those *asceticks*, that out of a pretence of keeping themselves unspotted from the world, take up their quarters in deserts. *Norris.*

He that preaches to man, should understand what is in man; and that skill can scarce be attained by an *ascetick* in his solitudes. *Atterbury.*

The truth is we have seen, and yet do see, religious societies whose religious doctrines are so little serviceable to civil government that they can prosper only on the ruin and destruction of it. Such are those which teach the sanctity of celibacy and *asceticism*.

Warburton's Alliance, book ii.

ASCETICS, persons in the primitive times who devoted themselves to the exercises of piety, in a retired life, and particularly to prayer, abstinence, and mortification. Afterwards this title was bestowed upon the monks, especially such of them as lived in solitude. This is also a title of several books of spiritual exercises, as the *Asetics*, or devout exercises of St. Basil, archbishop of Cesarea in Cappadocia, &c.

ASCHAFFENBURG, a town and district of Germany, on the Maine, formerly belonging to the elector of Mentz, who had a palace there, but now included in the kingdom of Bavaria. It is memorable for being the place where king George II. took up his quarters the night before the battle of Dettingen. It stands on an eminence, in a delightful country, and is of a quadrangular form. The number of inhabitants in the town is about 6400; they received a considerable augmentation by the emigrations from Mentz, on the occupancy of that city by the French in 1793. It has four churches, and a foundation called *Insignis Collegiata*, the capuchin monastery; the ancient Jesuits' college is now a lyceum or public school. Aschaffenburg was taken by the French in July 1796, and again in 1800. The rivulet of this name here discharges itself into the Maine. This town is eighteen miles south-east of Frankfort, and forty east of Mentz.

ASCHAM (Roger), was born at Kirby-Wiske, near North Allerton, in Yorkshire, in the year

1516. His father was steward to the noble family of Scroop. Roger was educated in the family of Sir Anthony Wingfield, who, about the year 1530, sent him to St. John's College, Cambridge, where he was soon distinguished for his application and abilities. He took his degree of A. B. at the age of eighteen; was soon after elected fellow of his college; and in 1536 proceeded A. M. In 1544 he was chosen university orator; and, in 1548, was sent for to court to instruct the lady Elizabeth (afterwards queen) in the learned languages. In 1550 he attended Sir Richard Morysine, as secretary, on his embassy to the emperor Charles V., at whose court he continued three years, and in the mean time was appointed Latin secretary to Edward VI. But upon the death of that prince, he lost his preferment and all his hopes, being professedly of the reformed religion; yet, contrary to his expectations, he was soon after, by the interest of his friend lord Paget, made Latin secretary to the king and queen. In June 1554 he married Mrs. Margaret How, with whom he had a considerable fortune. It is very remarkable, that, though Mr. Aschan was known to be a protestant, he continued in favor, not only with the ministry of those times, but with queen Mary herself. Upon the accession of Elizabeth, he was confirmed in his post of Latin secretary, and resumed his employment as preceptor to her majesty in the learned languages. He died in 1568, not rich, but much regretted, especially by the queen. He wrote, 1. *Toxophilus*. The schole or partitions of shooting, contained in two booke, written by Roger Aschan, 1544, and now newly perused. Pleasant for all gentlemen and yeomen of England, &c. Lond. 1571. This treatise was dedicated to Henry VIII. who settled a pension of £10 per annum upon the author. It is said to have been written principally to promote the improvement of English prose. 2. A Report of the affairs and state of Germany, and the emperor Charles his court, &c. 4to. 3. The Schoolmaster: first printed in 1573, 4to. Mr. Upton published an edition with notes, in 1711. It has uncommon merit. 4. Latin epistles; first published by Mr. Grant in 1576: the best edition is that of Oxford in 1703. These are much admired on account of the style, and esteemed almost the only classical work of the kind written by an Englishman. 5. *Apologia contra Missam*, 1577, 8vo. His works were collected and published by Bennet, in one volume, 4to. 1769, with a life, by Dr. Johnson.

ASCHERSLEBEN, the chief town of a district in the principality of Halberstadt, Prussia, is seated between the Eine and Wipper, sixteen miles south-east of Halberstadt. It was formerly a Hanse town, and the capital of the principality of Ascania, but was annexed to Halberstadt in the year 1320. Here are manufactures of frieze and flannel; and the suburbs, one of which is called the New Town, are well built. Inhabitants about 8000; and here are a Lutheran and Calvinist school; four churches, one of which, called the Market church, is possessed by the two sects in common. The castle is in ruins.

ASCHILLIUS, king of the Dacians, one of

those monarchs, who is said to have assisted king Arthur in his wars.

ASClA, in antiquity, an instrument supposed to be of the axe kind, used in the fabric of the Roman tombs, and frequently represented on them.

ASClA, in surgery, is a kind of bandage, somewhat oblique or crooked; whose form and use are described by Scultetus, in his *Armam. Chirurg.*

ASCIBURGIUM, in ancient geography, supposed to be one of the fifty citadels built on the Rhine, is mentioned by Tacitus, who adds, that some imagine it was built by Ulysses. Here was a Roman camp and a garrison. To its situation on the banks of the Rhine answers a small hamlet, now called Asburg.

ASCIDIA, a genus of animals belonging to the order of vermes mollusca. The body is cylindrical, and fixed to a shell, rock, &c. It has two apertures, one on the summit, the other lower, forming a sheath. These creatures have the power of contracting or dilating themselves; most of them are sessile. Gmelin enumerates the following species: papillosa, gelatinosa, intestinalis, quadridentata, rustica, echinata, mentula, venosa, prunum, conchilega, parallelogramma, virginea, canina, patula, aspersa, scabra, orbicularis, corrugata, lepadiformis, com planata, tuberculum, villosa, clavata, pedunculata, mammillaris, globularis, phusca, gelatina, crystallina, octodentata, patelliformis, pyura, aurantium, globularis.

ASCINDOE, in botany, a name given by the people of Guinea to a shrub, which they use in medicine, boiling it in water, and giving the decoction in gonorrhœas, and the like complaints. Petiver has named it the prickly Guinea shrub. The thorns on the large branches are very strong.

ASCITÆ; from *ασκος*, a bag or bottle; in antiquity, a sect of Montanists, who appeared in the second century; so named, because they introduced a kind of Bacchanals into their assemblies, who danced round a bag or skin blown up; saying, they were those new bottles filled with new wine, whereof our Saviour makes mention, Matth. ix. 17.—They are sometimes also called Ascrodigitæ.

ASCITES; from *ασκος*, a water bottle; in medicine, dropsy of the belly; so called from the protuberance of the belly in that disease resembling a bottle. It is divided into two species, ascites abdominalis, in which there is a regular and equal intumescence of the abdomen; and ascites saccatus, when the ovaries, &c. are the seat of the disease, and the swelling, at least in the beginning, is partial. The cure is difficult, since the disease is often only the symptom of a decaying constitution; evacuations are the chief palliatives, and paracentesis (*παρακεντησις*, to perforate), or tapping, relieves for a time, and, in some cases, permanently. See MEDICINE.

ASCLEPIA, a festival of Asculapius the god of physic, observed particularly at Epidaurus, where it was attended with a contest between the poets and musicians, whence it was likewise called *Ιερός τύπων*, the sacred contention.

ASCLEPIAD, in ancient poetry, a verse composed of four feet, the first of which is a spondee,

the second and third choriambuses, and the last a pyrrhichius : or of four feet and a cesura, the first a spondee, the second a dactyl, after which comes the cesura, then the two dactyls ; as

Mæcē[nā]s ētāvis | ēdīte | rēgibūs.
O ēt | prāsīdī|um | dūlcē dē|cūs mē|ūm.

ASCLEPIADES, a celebrated physician among the ancients, was a native of Prusa, in Bithynia, and practised physic at Rome, about A.C. 96. He was the head of a new sect ; and, by prescribing wine and cold water in the cure of the sick, acquired a very great reputation. He wrote several books, frequently mentioned by Galen, Celsus, and Pliny ; but they are now lost.

ASCLEPIADES, a famous physician under Adrian, of the same city with the former. He wrote on the composition of medicines, both internal and external.

ASCLEPIAS, SWALLOW-WORT, in botany, a genus of the digynia order, and pentandria class of plants ; ranking in the natural method under the thirtieth order, contortæ. The generic character is taken from five oval, concave, hornlike nectaria, which are found in the flower. There are nineteen species, of which the following are the most remarkable, viz. 1. A. haematochela, or common swallow-wort. 2. A. curassavica, or bastard ipecacuanha, a native of the warm parts of America. 3. A. Syriaca, or greater Syrian dogsbane. The root of the first species is used in medicine. Though reckoned by botanists a species of dogsbane, it may be distinguished from all the poisonous sorts, by its yielding a limpid juice. The root has a strong smell, especially when fresh, approaching to that of valerian, or nard ; the taste is at first sweetish and aromatic, but soon becomes bitterish, subacrid and nauseous. It is esteemed sudorific, diuretic, and emmenagogue. It is also frequently employed by the French and German physicians as an alexipharmac, and sometimes as a succedaneum to contrayerva, whence it has received the name of contrayerva Germanorum.

ASCLEPIODORUS, a British prince who flourished in the third century. He killed Alectus the Roman general, who had slain the celebrated Carausius ; and was elected king of the Britons, A.D. 232. He besieged and took London from the Romans, and threw Livius Gallus the Roman general into a brook, which thence received the name of Gallbrook, since changed into Wallbrook. He was at last slain by Coilus II. king of the Britons, A.D. 260.

ASCOBOLUS, in botany; from *ασκος*, a skin, and *βολος*, a cast ; so called because the seeds are thrown out with elasticity ; class, cryptogamia fungi. Its essential characters are, receptacle, fleshy, hemispherical ; seed-cases oblong, discharged elastically ; seeds moist, about eight. 1. A. furfuraceous, powdery ascobolus. Common on cow-dung late in autumn. 2. A. carneus, flesh-colored ascobolus ; found on dung in woods, rare. 3. A. glaber, smooth brown ascobolus, on cow-dung in autumn. 4. A. immersus, sunk ascobolus ; in the same situations, almost entirely sunk in the dung, so that the seed-cases only are prominent.

ASCODUTÆ, in church history, a sect of Christians, in the second century, who rejected all use of symbols and sacraments, on this principle, that incorporeal things cannot be communicated by things corporeal, nor divine mysteries by any thing visible.

ASCOGEPHYRUS, in writers of the middle age, a bridge supported on bags made of leather, or bullocks' hides. Such bridges appear to have been in use among the ancients, and to have given the denomination to a tribe of Arabs, hence called Ascitæ.

ASCOLI, anciently called Asculum Picenum, a pretty large and populous town of Italy, in the marquisate of Ancona, and territory of the church. It is a bishop's see, and seated on a mountain between the rivers Tronto and Castellano, forty-eight miles south of Ancona.

ASCOLI DI SATRIANO, formerly called Asculum Apulum, and Asculum Picenum, a city of Naples, in the Capitanata, with a bishop's see under the archbishop of Benevento, seventy miles east of Naples, and thirty west of Manfredonia.

ASCOLIA, in Grecian antiquity, a festival celebrated by the Athenian husbandmen in honor of Bacchus, to whom they sacrificed a he-goat, and made a foot-ball of his skin, because that animal destroys the vines. See *Virgil, Georg. ii. 380.*

ASCONIUS PEDIANUS, an ancient grammarian of Padua ; and, according to Servius, an acquaintance of Virgil's. He wrote commentaries on Cicero's Orations, fragments of which are published in Cicero's works.

ASCOPHORA, in botany ; from *ασκος*, bladder, and *φέρω*, to bear ; class cryptogamia fungi. Its essential characters are, thread-shaped, terminating in a slightly inflated head. There is but one species, viz. A. perennis, perennial bladder-mould.

ASCORCA, a town and valley of Majorca, six leagues from Palma, principally known by its famous sanctuary, Nuestra Senora de Lluch. This is a large and beautiful edifice, containing an image of the virgin, said to have been miraculously discovered on the spot in 1238. The number of persons connected with this establishment is 400. The canons are proprietors of the valley, which abounds in wine and olives.

ASCOUGH (William), L. L. D. appointed bishop of Salisbury in 1438, and soon after confessor to king Henry VI. He was seized by the famous rebel Jack Cade on the 28th June, 1450, who, after plundering his carriage, fell upon him the next day, while he was officiating at the altar, in Edington, Lincolnshire, and dragging him to a neighbouring hill dashed out his brains.

ASCRA, a village of ancient Greece near Mount Helicon, the birth place of the poet Hesiod.

ASCRIBE, Lat. *ad scribo*, to write to.

ASCRIBABLE, Primarily to practice the art of writing on any substance

ASCRIPTION, and with any instrument.

ASCRITI'TIOUS, Subsequently to charge, attribute, or place to the account of any one, whether in writing or otherwise.

Oh! ye traitours and maintainers of madness,
Unto your folly I *ascribe* all my paine;
Ye haue me deprived of ioy and gladnesse,
So dealing with my lord and soueraine.

Chaucer. Lamentation of Marie Magdalene,
fol. 319. ch. iv.

True wisdom teaches to distinguish God's actions,
and to *ascribe* them to the right causes.

Hall's Contemplations.

Ascribe thou nation, every favour'd tribe,
Excelling greatness to the Lord *ascribe*;
The Lord, the rock on whom we safely trust,
Whose work is perfect, and whose ways are just.

Parnell. The Gift of Poetry.

The cause of his banishment is unknown; because
he was unwilling to provoke the emperor, by *ascribing* it
to any other reason than what was pretended.

Dryden.

To this we may justly *ascribe* those jealousies and
encroachments which render mankind uneasy to one
another.

Rogers.

These perfections must be somewhere; and therefore
may much better be *ascribed* to God, in whom
we suppose all other perfections to meet, than to any
thing else.

Tillotson.

The greater part have been forward to reject it
upon a mistaken persuasion; that those phenomena
are the effects of nature's abhorrence of a vacuum,
which seem to be more fitly *ascribable* to the weight
and spring of the air.

Boyle.

Sometimes we *ascribe* to ourselves the merit of good
qualities, which if justly considered should cover us
with shame.

Craig.

Holiness is *ascribed* to the pope; majesty to kings:
serenity or mildness to princes; excellence or perfection
to ambassadors; grace to archbishops; honor to
peers.

Addison.

The innocent gambols of a few otters, have been
known to occasion those yellings which the vulgar of this
country mistake for laughing or crying, and *ascribe* to
a certain goblin, who is supposed to dwell in the
waters, and to take delight in drowning the bewildered
traveller.

Beattie.

ASCRIPPTI, or **ADSCRIPTI**, in antiquity, those
who entered their names in the colonies, and became
certain coloni.

ASCRIPPTITII, or **ADSCRIPTITII**, in ancient
barbarous customs, a kind of villains, who, coming
from abroad, settled in the lands of some
new lord, and became so annexed to the lands
that they might be transferred and sold with them.
Ascriptiti is sometimes also used in
speaking of aliens or foreigners newly admitted
to the freedom of a city or country.

ASCRIPPTITII was used in the military laws for
the recruits to supply the legions, called also
ACCENSI, which see.

ASCRIVIUM, in ancient geography, a town
of Dalmatia, on the Sinus Rhizicus, now called
Cattaro, in Venetian Dalmatia.

ASCULUM APULUM, and **PICENUM**. See
ASCOLI.

ASCUS, in natural history, the pouch or bag
of the opossum, for receiving its young. It is
a skinny bag, separate from the rest of the body,
but adhering by a membrane to the bottom of
the belly.

ASCYRUM, PETER'S WORT, in botany, a genus
of the polyandria order, and the polyadelphia
class of plants, ranking in the natural method
under the twentieth order, rotaceae: CAL. four
leaves: COR. four petals; the filaments are nu-

Vol. III.

merous, and divided into four bundles. There
are three species: 1. A. crux andreae; 2. A.
hypericoides; 3. A. villosum; all natives of the
West-Indies, or America.

ASDRUBAL, the name of several Carthaginian
generals. See **CARTHAGE**.

ASEKAI, **ASEKI**, the name which the Turkish
emperors give to their favorite sultanas, generally
those who have brought forth sons. These are
greatly distinguished above others in their apart-
ments, attendants, pensions, and honors. They
have sometimes shared the government. The
sultana who first presents the emperor with a
male child is reckoned the chief favorite, and is
called buyuk aseki.

ASELE-LAPPMARK, a division of Swedish
Lapland, contains the large parish of Asele, sixty
English miles in length. In the town of this
name there is a church, erected in 1648. Here
is also a school, established in 1730, where six
children of Laplanders are educated at the ex-
pense of the government. This place is moreover
the seat of a court of justice, and has a yearly
fair. The inhabitants trade in reindeer
skins, flesh, butter, cheese, fowls, fish, and furs.
Eighty-five miles west of Umea. Long. 17° 4
E, lat. 64° 12' N.

ASELI, **ASELLA**, in entomology, a species of pha-
lana, of the bombyx family, found in Germany,
wings brownish without spots.

ASELLI, in astronomy, two fixed stars of the
fourth magnitude, in the constellation Cancer.

ASELLI or **ASELIUS** (Caspar), an Italian
anatomist of the seventeenth century, who dis-
tinguished himself by discovering the lacteal
vessels. He was born at Cremona, and studied
medicine, and became professor of anatomy in
the university of Pavia. Aselli first observed
the lacteals in dissecting a living dog. His
investigations were published after his death at
Milan in 1627.

ASELLINA, in zoology, a species of *Lernæa*,
having the body lunated, and the thorax heart-
shaped. Found fixed on the gills of some fishes.

ASELLUS, in entomology, a species of the
oniscus genus; of an oval shape, with an obtuse
tail, furnished with two styles. It delights in
moist places, under stones, in damp and rotten
wood, &c. The young are contained in a four-
valved receptacle, under the abdomen of the
female. This is commonly known by the name
of the wood louse.

ASELLUS, in conchology, a species of chiton,
most frequently found adhering to the *mytilus*
modiolus. The shell consists of eight valves, very
black, with a yellow spot on each valve, convex
above; also a species of *cyprea*, common about
the Madeira islands. It is white, with three
brown bands bordered with yellow or red.

ASENATH, the daughter of Potipherah, priest
or prince of On, and wife of Joseph, prime min-
ister to Pharaoh king of Egypt. See *Genesis*
xli. 45.

ASEPTA; in medicine, from *a* negative, and
σητω, to putrefy; signifies any thing unputrefied,
or unconcocted.

ASGILL (John), a humorous writer, bred to
the law, which he practised in Ireland with great
success. He was there elected a member of the

D

house of commons, but was expelled for writing a Treatise on the Possibility of avoiding Death. Being afterwards chosen member for Bramber in Sussex, he was on the same account expelled the parliament of England. After this, he continued thirty years a prisoner in the Mint, Fleet, and King's Bench; during which time he published a multitude of political pamphlets. He died in the King's Bench in 1738, aged above eighty.

ASH', n. & v. Ang.-Sax. Asia, asce; dust; **Ash'y,** { ashes. The remains of any **Ash'tub,** } substance which has been **Ash'ypale.** burnt.

Ye Troyan *ashes*, and last flames of mine,
I cal in witnesse, that at your last fall,
I fled no stroke of any Grekish sword. *Surrey.*
Poor key-cold figure of a holy king!
Pale *ashes* of the house of Lancaster!
Thou bloodless remnant of that royal blood! *Shakespeare.*

So that lone bird in fruitful Arabie,
When now her strength and waning life decays,
Upon some aerie rock or mountain high,
In spiced bed, fired by near Phœbus rayes,
Herself and all her crooked age consumes,
Straight from the *ashes*, and those rich perfumes,
A new-born phoenix flies, and widow'd place resunes,
Fletcher's Purple Island.

Porneius next him pae'd, a meagre 
Whose leaden eyes sunk deep in swimming head,
And joyless look, like some pale *ashy* sprite,
Seem'd as he were dying, or now dead. *Id.*

His *ashy* coat that bore a gloss so fair,
So often kiss'd of the enamour'd air,
Worn all to rags, and fretted so with rust,
That with his feet he trod it into dust. *Drayton's Poems. The Owl.*

Ah! leave me not for Grecian dogs to tear;
The common rites of sepulture bestow,
To soothe a father's and a mother's woe;
Let their large gifts procure an urn at least,
And Hector's *ashes* in his country rest. *Pope.*

To great Laertes I bequeath
A task of grief, his ornaments of death;
Lest, when the fates his royal *ashes* claim,
The Grecian matrons taint my spotless name. *Id.*
Ash, { Of doubtful etymology. Todd's
Ash'en. } Johnson gives *aspe*, a tree.
There sawe I eke the fresh hauthorne,
In white motley that so swote doth smell,

Ashe, firre, and oke with many a young acorn,
And many a tree mo than I can tell.

Chaucer. *The Complaint of the Black Knight.*
f. 271. c. 1.

For whan we may not don, than wol we speken,
Yet in our *ashen* cold is fire yreken.

Id. *The Reeve's Prologue*, v. i. p. 153.

As from some far seen mountain's airy crown,
Subdu'd by steel a tall *ash* tumbles down,
And soils its verdant tresses on the ground;
So falls the youth; his arms the fall resound.

Pope. Iliad.

Then exercise thy sturdy steers to plough
Betwixt thy vines, and teach the feeble row
To mount on reeds, and wands, and upward led
On *ashy* poles, to raise their fork'd head.

Dryden's Virgil, Georg. ii.

Asu (John), L.L.D. a baptist minister, born in 1724; was at one period coadjutor with Dr. Caleb Evans in the management of the Bristol academy, and subsequently pastor of a congregation at Pershore, where he died in 1779. Besides several religious publications, he was the author of a Dictionary of the English language; and an Introduction to Lowth's Grammar, which has passed through a great number of editions.

ASHAME, { Found in all the Northern

Asha'med. } languages. It has perhaps a literal affinity to *αυρωπω*, to blush, to redden; although, according to our usage, it means the feeling that occasions the blush; to feel shame. See SHAME.

And whanne he seide these thingis alle his aduersaries weren *ashamed*: and al the puple joyede in alle thingis: that weren gloriously don of him. *Wyclif. Luk. c. 13.*

Some men seem to be *ashamed* of those things which would be their glory, whilst others glory in their *shame*. *Mason on Self-knowledge.*

Ye only can engage the servile brood
Of levity and lust, who all their days
Ashamed of truth and liberty have wo'd,
And hug'd the chain that glittering on their gaze,
Seems to ountshine the pomp of heaven's empyreal
blaze. *Brattie's Minstrel.*

The modest speaker is *asham'd* and griev'd
T'engross a moment's notice, and yet begs,
Begs a propitious ear for his poor thoughts,
However trivial all that he conceives. *Courper's Task.*

A S H A N T E E.

ASHANTEE, a native kingdom of the Gold Coast of Africa, and an important power in the neighbourhood of our settlements on the western coast. It appears to be far superior in civilisation, commerce, and general resources, to any known African state. The predominance of this power indeed has, within the last ten years, entirely altered the political aspect of the coast. It is well known that our late excellent and intrepid commander on this coast, and at Sierra Leone (Sir Charles Macarthy), lost his life in a fruitless attempt to drive back a considerable force of the Ashantees from the Gold Coast. A late war between the Fantees and the king of Ashantee first brought the latter country to the knowledge of Europeans. The Fantees had long plundered the Ashantee merchants, and treated

with contempt the remonstrances of that kingdom, till at last the Ashantees over-ran the country, entirely reduced the Fantees, and besieged the British settlement. A mission was now therefore sent to the king of Ashantee, to conciliate his good-will toward this country, to obtain, if possible, an extension of commerce, and to gain a knowledge of that kingdom, and the adjacent countries.

ASHANTEE, according to the elaborate account of Mr. Bowdich, employed on this mission, is situated at a distance from the coast, on the west of Dahomy, and nearly in the longitude of the central parts of England. Its extent is supposed to be great, though still imperfectly known to Europeans, and must, indeed, be so in a great measure to the inhabitants themselves. Where

no records are kept, and the communications are only received from those who levy the tribute, no great accuracy can be expected, either as it relates to extent of country or number of inhabitants. It spreads principally over a wide space westward and towards the interior. Ashantee Proper does not border on the coast which is occupied by the tributary countries. The surface of this country is variegated, but the cultivation is partial, and much of it is over-run with forests of brush-wood, and the luxuriance of a tropical vegetation. A river called the Volta is formed of two streams which intersect the Ashantee territory. South-east of Coomassie, the capital, a small lake is laid down in Mr. Bowdich's map. No means of ascertaining the population presented itself to the members of the mission, but by that of the military force. Of this they give the following, as the most moderate estimate received :

Coomassie district, extending to the north-	
ern frontier	60,000
Dwabin ditto	35,000
Morpon ditto	15,000
Soota ditto	15,000
Kakoofoo ditto	15,000
Beequa ditto	12,000
Adiabin ditto (between Coomassie and the lake)	12,000
Aphwagwasee ditto	10,000
Danijasee ditto (southward of Coomassie)	8,000
Koontarasie ditto (on the lake)	8,000
Gomasie ditto	8,000
Amafas ditto	8,000
	—
	206,000

The Ashantees being a nation of warriors, this statement may amount to nearly one-fifth of the whole population, which will, therefore, be about one million. The area of Ashantee Proper is estimated by the same writer at 14,000 square miles, which is consequently about seventy-one persons to each; a population rather greater than that of Scotland. The climate of Ashantee is colder than that of Cape Coast. During May and June, the first two months that the mission was at Coomassie, it rained about one-third of the time; in July and August, it rained nearly half, and violent tornadoes, ushered in by strong winds from the south-west, were frequent after sun-set. The heaviest rains fell from the latter end of September to the beginning of November, when they descended in more impetuous torrents than are usual on the coast. On the second of May Fahrenheit's thermometer rose to 91°, and the following day, at twelve o'clock, it was 89°. From the 7th to the 14th of June, it varied at Coomassie from 80° to 85°. It appears that the general temperature of Coomassie, during the hottest part of the day, is between 70° and 84°.

The agriculture and products are similar to those of other parts of south-west Africa. The soil is chiefly a light loam, and the only agricultural instrument is the hoe. Their plantations have much the appearance of hop-grounds, are well formed and regularly planted; a hut being

erected at each wicker-gate where a slave and his family generally reside. They grow two crops of corn a year; plant their yams about Christmas, and dig them up in September. They also cultivate rice, sugar-canapes, a mucilaginous vegetable, called encruma, resembling asparagus, pepper, vegetable butter, oranges, papaws, pineapples, and bananas. Fine cotton also grows spontaneously in Ashantee. The cattle seen by the embassy were as large as those in England. The horses are small, and the Ashantees bad horsemen. The Moors sometimes ride oxen with rings through their noses. The sheep are covered with hair. Among the wild animals are lions, panthers, elephants, hyenas, goats, deer, and antelopes; besides abundance of the monkey species: of these, the simia diana, is much admired for the beauty of its skin. The alligator, rhinoceros, and hippopotamus, are also met with; among the birds vultures are numerous, as well as pigeons, crows, and parrots. Various singing birds were likewise seen. Ashantee either is not a mineral country, or the inhabitants cannot avail themselves of its treasures, as the gold and other metals are imported. Iron-stone, however, is found in several places, and particularly in the neighbourhood of Coomassie, the metropolis, which is built upon the side of a large rocky hill, and is insulated by a marsh northward. This marsh contracts into a narrow stream on the southern and eastern sides, and supplies the town with water. Around the town is a beautiful forest. Coomassie is an oblong of nearly four miles in circuit, not including the suburbs of Assafoo, or Bantama (the black town), half a mile distant, and formerly connected with the streets. Four of the principal of these streets are half a mile long, and from fifty to a hundred yards wide. Mr. Bowdich observed them building one, and a line was stretched on each side to make it regular. The streets are all named, and a superior captain has charge of each. That where the mission resided was called Aperremsoo, great-gun, or cannon-street, because the guns taken when Dankara was conquered, were placed on a mound at the top of it. The Ashantees asserted that the entire population of Coomassie exceeded 100,000; and Mr. B. says, that on festivals, when the people were collected, he compared the crowds to those he had seen in the secondary cities of England. The higher classes support their numerous followers, and the lower their large families, in plantations within two or three miles of the capital. Mr. B. thinks the average resident population of Coomassie, exclusive of those of the surrounding crooms, does not exceed 15,000. There are two markets held daily, from about eight o'clock in the morning till sunset, where the articles exhibited for sale, are beef and mutton, hogs, deer, and monkey's flesh; fowls, with the vegetable products of the country; salt and dried fish from the coast, large snails smoke-dried, and stuck in rows on small sticks in the form of herring-bone; eggs for fetish, palm-wine, rum, pipes, beads, looking-glasses, sandals, silk and cotton cloth, gunpowder, small pillows, white and blue cotton thread, calabashes, &c. Provincial capitals, and other large towns of t

interior, were spoken of to the gentlemen of the mission, but were little known, it appeared, at the capital.

The king's love of justice is esteemed by his courtiers as his chief virtue. They have no ideas of extending their influence by civil policy. The cefoceers, or military captains, accordingly form the lowest grade of the constitution, over whom are placed the heads of but four families, which form a sort of aristocracy, and, with the king, complete the three estates of this kingdom. In exercising his judicial authority, or in laying the basis of a new law or measure, the king always retires in private to consult these four chief dignitaries; but every law is announced publicly to them as well as to the assembly of captains, as the arbitrary pleasure of the king. On state emergencies only, are the latter assembled distinctly, or to give publicity to some new law. The Ashantees are fully capable of vindicating this constitution by argument, according to the testimony of our officers who visited the court of Coomassie; indeed, no system of government would seem better suited to their habits and propensities. The captains are made responsible, in a great degree, for the issue of their own advice with respect to war or peace; we only wish we could add, that in mode of conducting hostilities, they were as humane as they are energetic and skilful.

In this respect, they are still barbarous in the highest degree. They rarely give quarter in a general action, and a distinct body of recruits follows the army to despatch with knives those who are wounded with a musket, and return with the personal spoil of the enemy. They even make a practice of cutting out the hearts of some of the slain, which they mix up with consecrated herbs, and after much ceremony and incantation, compel those who have never before killed an enemy, to eat part of the horrible portion. Of the heart of a celebrated enemy, the king and his dignitaries are said to partake; and their most warlike generals are distinguished by names descriptive of their peculiar modes of despatching or torturing their enemies. Thus, Apokon, the king, is called Aboawessa, because he has been in the habit of cutting off their arms; Appia, Sheaboo, because he beats their heads in pieces with a stone; and Amanqua, Abiniowa, because he cuts off their legs. Sir Charles M'Carthy, it is feared, was despatched by these barbarians in this cruel manner.

The last power subdued, or the revolters recently quelled, are always compelled by the Ashantees to form the van of their army; the youngest captain marches first, and all the authorities in gradation of rank and seniority up to the king. The superior discipline and courage of their soldiery were in a moment perceptible, when they appeared in conflict with the people of the coast before Annamaboe; but the following are said to be the only maxims to which this is to be attributed: They never pursue an enemy at or near sunset; the general is always in the rear, the secondary captains lead the soldiers on, while the chiefs of divisions, surrounded by a few select followers, urge them forward with heavy swords, and cut down every

man who retreats, until the conflict is desperate. In close fight, the principal effort of the Ashantee is to fire, and then spring upon the throat of his enemy. The most popular song of the capital, has a sort of chorus to this effect: 'If I fight I die, if I run away I die, better I go on and die.'

At the Yam Custom, an annual festival, and at the death of their great men, hundreds of human victims are said to be regularly sacrificed, and the skulls and other bones of their enemies are exhibited in their armoury, and as the ornaments of their state apartments. At all their great festivals and funerals, indeed, the slaughter of human beings is horribly frequent. Some of the former occur once in three weeks, when 100 are sometimes immolated. It should be observed, however, that these are often convicts. The king celebrated the death of his mother by the sacrifice of 3000 victims; and the funeral rites of a great cabocceer were repeated at intervals for three months, during which 2400 persons were butchered.

According to the religious belief of the Ashantees, there are two distinct orders of gods; one of which, the higher order, takes care of the whites, the other of the blacks; they are believers in the immortality of the soul, and both their princes and nobility are supposed to enjoy the presence of the higher order of their deities after death. Here they regale themselves in epicurean indulgence, and have cooks and butlers after the fashion of their country. Persons of this description are, therefore, buried with their great men, whose reception in another world is supposed to be greatly regulated by the number of attendants with which they appear. The Ashantees have also two sets of priests; one class being devoted to the services of their temples and to preserving a communication with their deities, and the other class a sort of conjurors, and detectives of small theft. Every housekeeper also has his domestic gods and charms, bought of these cunning men. Polygamy is universally allowed, and the king claims the royal number of 3333 wives, which is regularly kept up; the ladies living in round enclosures, 'like pheasants in a park.'

A peculiar feature in the law of succession obtains in this country, and is binding from the royal family downwards. The brothers' children are always set aside in favor of sisters' children, on the ground that if the sons' wives are faithless, the blood of a family is lost in the offspring; but should the daughters deceive their husbands the father's blood is still preserved; thus, the sisters of the king are allowed to intrigue or marry with any personable man. The king is heir to all the gold of any subject, and contributes to the funeral rites to assert his claim; the successor paying the debts of the deceased. Slaves, if ill treated, may transfer themselves from one master to another. They are a great article of traffic here, and the domestic drudges, of course, of the country. No topic appeared so inexplicable to the king as that of the British motives for abolishing the slave-trade. The slaves of an ally or tributary are scrupulously restored; those of an indifferent or enemy's

country may become free subjects of the state. An appeal lies for the subjects of any tributary power to the laws, and ultimately to the king of Ashantee.

Cowardice, treason, the murder of an equal, and some cases of adultery, are punishable with death, as are false accusations of treason. A great man killing his equal, is generally afterwards allowed to kill himself as a punishment; but the death of an inferior is compensated by a fine, paid to the family, of the value of seven slaves. Serious thefts are punished with a compensation inflicted on the family of the accused, who alone are suffered to punish him; but this they may do even capitally, if he be incorrigible. Trifling thefts are visited on the offender by exposing him at various parts of the town, and proclaiming his crime before him. But all vexatious suits and accusations are discouraged and punished. Polygamy is allowed to all ranks, but the wife's property is distinct from that of her husband, and the king is the heir of it. None but a captain can put his wife to death for infidelity, and even then he is expected to accept a liberal offer of gold for her redemption. To intrigue with the king's wives is death. If the family of a woman, on her complaint of ill-treatment, choose to tender to a man his marriage-fee, he must accept it; and the wife returns to her father's house, but can no more marry. 'The most entertaining delassement of our conversation,' says Mr. Bowdich, 'with the chiefs, was to introduce the liberty of English females; whom we represented, not only to possess the advantage of engaging the sole affection of a husband, but the more enviable privilege of choosing that husband for herself. The effect was truly comic; the women sidled up to wipe the dust from our shoes with their clothes, at the end of every sentence brushed off an insect, or picked a burr from our trowsers; the husbands expressing their dislike by a laugh, would put their hands before our mouths, declaring that they did not want to hear that palaver any more, abruptly changed the subject to war, and ordered the women to the harem.'

The foreign trade of Ashantee is regulated by the government, so far as to interdict commerce with any unfriendly power. It is in every other respect left free, though not much encouraged. The slaves of the capital are generally a part of the annual tribute of the neighbouring powers; but many are kidnapped throughout the country. They fetch but a trifle; but it is the most lucrative branch of their commerce with the coast; and the continuance of it under other flags, particularly the Spanish, while the British are prohibited from engaging in it, is represented by the intelligent writer, to whom we have been already so much indebted, as the most stubborn impe-

diment to the negociations which he had to conduct at Ashantee. 'It not only injures the British commerce here,' says Mr. B. 'almost to annihilation; but, slavery being the natural trade of the natives, because it is the most indolent and the most lucrative, the opposition, which is insinuated and believed to proceed from the English alone, conveys a disagreeable impression of us to the interior, as inauspicious to our intercourse and progress, as the even partial continuance of such a trade is to legitimate commerce and civilisation. One thousand slaves left Ashantee, for two Spanish schooners, or Americans under that flag, to our knowledge, during our residence there; doubtless the whole number was much greater. Since our return it must have been very considerable, for the slave trade was never more brisk than it is at this moment, under the cloak of the Spanish flag; and great risk has been incurred, in consequence, of offending our new friend and formidable neighbour, the king of Ashantee, from the firm resistance of his strong entreaties to the governor-in-chief to allow the return of a powerful mulatto slave-trader to Cape Coast Town, whence he had been expelled under the present governor, as the most daring promoter of that commerce.' How urgently does [redacted] press upon government, by all legitimate means, to urge the universal abolition of this accursed traffic! It is but 'crippled,' as this writer well remarks, at present, 'at the expense of our own interests and views in the interior; and, which is worse, of the happiness and improvement of the natives.'

Gold was seen everywhere in great abundance by the British emissaries; and the court of Coomassie, in silks, stuffs, cloths, and cottons, of every hue, was most imposing. Some of the captains wore ornaments of solid gold on their wrists, so large as to tire the hand, which rested on the head of a young slave. The tops of immense umbrellas were decorated with golden heads of pelicans, panthers, baboons, &c. as large as life.

Guns and gunpowder are never allowed to be exported from Ashantee; and the people in general have no idea of buying any thing but for the purpose of consumption, except a small number of articles of which they can make a profitable barter for tobacco, cloth, and silk, in the Inta and Dagwumba markets. Their situation bids fair, however, for their becoming the complete brokers between the interior and the European nations.

We subjoin a table of the most material articles of commerce between our settlement at Cape Coast Castle and the Coomassie market, and the profit they will yield, according to Mr. Bowdich, at the latter:

Articles.	CAPE COAST.			Quantity.	COOMASSIE.			Profit per cent.	
	£.	s.	.		£.	s.	d.		
1 Cushions	—	—	—	—	1	0	0	each.	100
2 Dagwumba white cotton	—	—	—	—	0	5	0	square yard.	100
3 Flints	0	5	0	100	0	0	3	each.	600
4 Glasgow Dane	1	10	0	per piece.	0	5	0	per handkerchief.	75
5 Guinea stuff	0	10	0	do.	0	15	0	—	50
6 Gunpowder	4	0	0	½ barrel.	0	0	7½	per charge.	400
7 Iron	1	0	0	bar.	1	15	0	bar.	75
8 Lead	0	10	0	—	0	0	7½	½ inch.	75
9 Locks (Marrowa)	—	—	—	—	0	5	0	each.	100
10 Romal	1	0	0	per piece.	1	5	0	piece.	20
11 Rum	0	10	0	gallon.	0	0	7½	dram.	400
12 Sandals	—	—	—	—	0	10	0	pair.	100
13 Sarstracunda	0	10	0	piece.	0	2	6	per span.*	400
14 Silesia	1	10	0	do.	0	15	0	piece.	50
15 Silk, India	4	0	0	do.	0	5	0	per span.	175
16 Fezzan	—	—	—	—	2	0	0	per fathom.	100
17 Spanish dollars	0	5	0	—	0	5	0	—	—
18 Tobacco, Portuguese	6	0	0	Roll.	10	0	0	roll.	75
19 Inta	—	—	—	—	0	2	6	lb.	150

* The span is about nine inches long ; the fathom eight spans.

Gold dust is the currency of Ashantee, worth about £4 English an ounce. That of the neighbouring kingdoms of Inta, Dagwumba, Gaman, and Kong, is reckoned in cowries, of which five strings, or 200, make a tokoo : eight tokoos an ackie ; and sixteen ackies an ounce.

Mr. Bowdich recommends that a British settlement should be attempted up the Volta, which is navigable within four days' journey of Sallaghá, the capital of Inta, east of which, and on the banks of Laka river, connected with the Volta, is the kingdom of Dagwumba. These tributary nations to Ashantee are far more commercial in their policy than that state ; and, as far, as they have become known to us, more civilised. They give exorbitant prices to the Ashantees for rum, iron, &c. Silks, Manchester cloths, and cottons, would find a market in the same direction.

In their architecture the Ashantees have claims to surprising neatness, and even elegance. Although the walls are of mud, every house in Coomassie has its regular gable ends, from which three poles are projected, i.e. from end to end, forming the point and bottom of the roof on each side ; in which a frame of bamboo work supports an interwoven thatch of palm leaves, tied with the runners of trees. Within, the bamboo work is painted black and polished, so as to form a sort of chequered and tasty ceiling. The pillars that assist to support the roof, and form the open front of the superior houses, are squared pieces of timber, covered with plastering, and often or-

namented with fluting, quarter-foil, and the lozenge and gable ornaments of the Normans. The steps and raised floors of these houses are clay and stone, covered with a layer of red earth which has the appearance of ochre. Arcades and piazzas abound everywhere in the capital. The doors are generally an entire piece of the cotton wood ; the windows open wood work, carved in fantastic shapes, and painted red ; the frames being frequently cased in gold as thick as cartridge paper. Mr. Bowdich was agreeably surprised to find every house have its cloaca in some retired and arched corner, besides the common ones about the town for the lower orders. The holes, he says, are dug to a surprising depth, and boiling water is poured down them every day. The rubbish and offal of the houses is burnt every morning in the back of the street. In their persons, and in all their domestic economy, the Ashantees are also patterns of cleanliness.

They manufacture cloths of exquisite fineness and brilliancy of color, sometimes unravelling the finest silks, to weave them into them. They paint on white cloths ; and dye with considerable skill, particularly leather ; in pottery, blacksmith's work, tanning and dressing leather, they also excel. They will buy British cottons for the sake of a favorite stripe (generally the red), and cutting away the other parts, weave it up into their own cloths, which alone are worn as articles of dress.

ASHBORN, or ASHBOURNE, a town in Derbyshire, on the borders of Staffordshire, between the rivers Dove and Compton, thirteen miles from Derby, and 139 N. N. W. from London

It has a stone bridge over the Dove ; an ancient church with a fine spire ; and a free school, founded by citizens of London, natives of the place. Its trade in malt and cheese is consider-

able. A weekly market is held here, and several annual fairs. Population 2112.

ASHBURNHAM, a post town of the United States, in Worcester county, Massachusetts, on the west side of the river Sowhegan, forty-five miles north-west of Boston.

ASHBURTON, a town in Devonshire, seated on the river Dart, ten miles from Totness, nineteen south-west of Exeter, and 192 west by south of London. It carries on a considerable trade, in wool, yain, and serges; has markets on Tuesday and Saturday, and fairs on the first Thursday of March and June, and on the 10th August and 11th November. It sends two members to parliament, and is one of the four stannary towns. It is seated among the hills, which abound in tin and copper; and has a very handsome church, with a chapel, which is used as a school. Population about 3000.

ASHBY DE LA ZOUCH, a market town of Leicestershire, so called from the Zouches, its ancient lords, 13 miles south of Derby, 15 from Leicester, and 115 from London. It has seven annual fairs. It long had a castle, which was in the possession of the family de la Zouch. It afterwards fell into the hands of Edward IV. who granted it to Sir Edward Hastings, with the title of a baron, and license to make a castle of the manor-house, to which he adjointed a very high tower. James I. and his whole court were once entertained here by the Earl of Huntingdon. It was demolished in 1643. Malting, and the manufacture of hats and cotton, flourish here. Population upwards of 3000. In the neighbourhood is a mineral water called Griffydam.

ASHDOWN, a town of Essex, anciently called Assandum, or the hill of asses, famous for the defeat of Edmund Ironside, by Canute the Dane.

ASHER ; אַשָּׁר, Heb. i. e. blessedness; one of Jacob's sons by Zilpah, and the progenitor of the tribe so called.

ASHEREF, or ASHRAFF, a town of Persia, in the Mazanderan province, half a mile from a large bay, the best harbour on the south side of the Caspian. Shah Abbas built a superb palace here, surrounded by fine gardens, remarkable for the number of their orange trees. This palace is now falling to ruins. Distant fifteen miles from Fehrabad, and sixteen from Sari.

ASTES, among the ancient Persians, were used as an instrument of punishment for some great criminals. The criminal was thrown head-long from a tower fifty cubits high, which was filled with ashes to a particular height, 2 Mac. xiii. 5, 6. The motion which the criminal used to disengage himself from this place, plunged him still deeper into it, and this agitation was farther increased by a wheel which stirred the ashes continually about him, till at last he was stifled.

ASHES, in chemistry, are the earthy particles of combustible substances after they have been burnt. If the ashes are produced from vegetable bodies, they contain a considerable quantity of fixed salt, blended with the terrene particles: and from these the fixed alkaline salts called potash, pearl-ash, &c. are extracted. See POTASH, &c. The ashes of all vegetables are vitrifiable, and found to contain iron. They are also an

excellent manure for cold and wet grounds.
HUSBANDRY.

ASHES were anciently used in several religious ceremonies. St. Jerome relates that the Jews in his time rolled themselves in ashes, as a sign of mourning. To repent in sackloth and ashes is a frequent expression in Scripture for mourning and being afflicted for our sins. There was a sort of lye and lustral water made with the ashes of an heifer sacrificed upon the great day of expiation; the ashes whereof were distributed to the people, and this water was used in purifications as often as any touched a dead body, or was present at funerals, Num. xix. 17.

ASH-FIRE, among chemists, a fire wherein the vessel to be heated is covered with ashes or sand.

ASHI, a prince of Norway, said to have been slain by Fingal, the father of Ossian, at a place of Invernesshire, ever since named Drumashi, or Ashi's Hill.

ASHIMA, an idol of the Samaritans, 2 Kings xvii. 30, said to have been formed like a lion or a goat, and to have represented the sun.

ASHING-KEY, a low island on the Spanish main, on the Mosquito shore.

ASHIPOO, a river of North America, in South Carolina, which runs into the Atlantic. Long. 30° 30' E. lat. 32° 25' N. Also a town of the same name situated on the banks of this river.

ASHLAR, in masonry, free-stones as they come out of the quarry, of different lengths, generally applied to slabs of stone, from six to nine inches in thickness, used for facing brick buildings, worked in imitation of regular courses of solid masonry.

ASHLER, or ASHLERINE, quartering of timber about three feet high, placed perpendicularly from the floor of the attic story, to the roof to obviate the useless angle formed by the junction of the roof and the floor.

ASHLEY, a river of South Carolina, rising in Cypress swamp, and emptying itself into the Cooper just below Charleston. Its breadth opposite Charleston is about 2100 yards, and its stream narrows but little for several miles. On the western bank of this river the first efficient settlement of the state was made at a place now called Old Town, or Old Charleston, in 1671. Also a river of West Florida, which runs into the Gulf of Mexico.

ASHMOLE (Elias), a celebrated antiquary and herald, founder of the Ashmolean Museum at Oxford, was born at Litchfield, in Staffordshire, 1617. He first practised in the law: in the civil war he had a captain's commission, and was also comptroller of the ordnance under Charles I. In 1649 he settled at London; where his house was frequented by most of the learned men of the age, and a depositary of many literary treasures. In 1650 he published a treatise written by Dr. Arthur Dee, relating to the philosopher's stone; with another tract on the same subject by an unknown author. About the same time he was busied in preparing for the press a complete collection of the works of such English chemists, or alchemists rather, as had till then remained in manuscript. This undertaking cost him great labor and expense; but at length the work appeared towards the close of

the year 1652, under the title of *Theatricum Chymicum Britannicum*. He proposed at first to have carried it on to several volumes; but afterwards dropped this design, and applied himself to the study of antiquity and records. He was at great pains to trace the Roman road, which in Antoninus's Itinerary is called Bennevanna, from Weedon to Litchfield. In 1658 he began to collect materials for his celebrated history of the Order of the Garter. In September following he made a journey to Oxford, where he commenced his full and particular description of the coins presented to the public library by archbishop Laud. Upon the restoration, Mr. Ashmole was introduced to king Charles II. who bestowed on him the place of Windsor Herald. Soon after he appointed him to give a description of his medals, which were accordingly delivered into his possession, and king Henry VIIIth's closet was assigned for his use. Mr. Ashmole was afterwards admitted a fellow of the Royal Society; and the king appointed him secretary of Surinam, in the West Indies. On the 19th July 1660, the University of Oxford, in consideration of the many favors they had received from Mr. Ashmole, created him M. D. by diploma. In May 1672 he presented his Institution, Laws, and Ceremonies of the Order of the Garter, to the king, who, at his approbation granted him £400 out of the custom on paper. On the 26th January, 1679, a fire broke out in the Middle Temple, in the next chamber to Mr. Ashmole's, by which he lost a noble library, with a collection of 9000 coins, ancient and modern, and a vast repository of seals, charters, and other antiquities and curiosities; but his manuscripts, and his most valuable gold medals, were luckily at his house at Lambeth. In 1683, the University of Oxford having finished a magnificent repository near the theatre, Mr. Ashmole sent thither his collection of rarities; which benefaction was augmented by the addition of his manuscripts and library at his death, which happened at Lambeth, May 18, 1692, in the 76th year of his age. Besides the works above mentioned, Mr. Ashmole left several which were published since his death, and some which still remain in manuscript.

ASHMOT, the principal part of the Isle Madame, dependent on the island of Cape Breton.

ASHORE. On shore. Ang.-Sax. *seiran*, to shear, cut, divide, separate. See *SHORE*.

Sweare then how thou escap'dst.
Swun' ashore man like a ducke! *Shakspeare.*

For now the flowing tide,
Had brought the body nearer to the side;
The more she looks, the more her fears increase,
At nearer sight; and she's herself the less:
Now driv'n ashore, and at her feet it lies,
She knows too much in knowing whom she sees.
. Her husband's corpse. *Dryden's Fables.*
[He] Then with his dire associates through the deep,
For spoil and slaughter guides the savage prow,
Him dogs will rend ashore.

Glover's Leonidas, book xii. p. 77.
Thus while their cordage stretch'd ashore may guide,
Our brave companions thro' the swelling tide;
Tis floating lumber shall snare in them o'er
The rocky shelves, in safety to the shore.

Falconer's Shipwreck.

Storms rise t' o'erwhelm him : or if stormy winds
Rise not, the waters of the deep shall rise
And needing no assistance of the storm,
Shall roll themselves ashore and reach him there.

Couper's Poems.

ASHTAROTH, Ashtoreth; אַשְׁתָּרָה, Heb. i. e. flocks, or riches; or ASTARTE, the chief goddess of the Sidonians and Phoenicians, called also the Queen of Heaven, and reckoned the same with the Juno of the Greeks and Romans. Cicero, however, calls her the Venus of Syria, wherein he is certainly justified by her mode of worship; which, like that of the Grecian Venus, abounded in all manner of debauchery. The Israelites in all their relapses to idolatry showed a great fondness for her worship. Solomon himself in his dotage sacrificed to her. She was represented in various habits, encircled with rays, &c. We find a place named after her in the days of Abraham; Gen. xiv. 5.

ASHUTON (Charles), an antiquarian and one of the most learned critics of his age, was elected master of Jesus College, Cambridge, July 5th 1701, and installed prebend of Ely, on the 14th. His skill in ecclesiastical antiquities was equalled by few.

ASHTON (Dr. Thomas), a native of Eton, studied at Cambridge, in 1733, was successively rector of Aldingham, Starminster, and St. Botolph, Bishopsgate. In 1759 he took his degree of D. D.; and in May 1762 was elected preacher at Lincoln's Inn, which he resigned in 1764. He died in 1775, aged fifty-nine. He published, 1. A volume of Sermons. 2. A Dissertation on H. Peter, i. 19. 3. A letter to the Rev. Mr. Jones. 4 & 5. Two Letters to Dr. Morell, on Electing Aliens into places in Eton College; and 6. An Extract from the case of the Obligation of Electors, &c.

ASUTON-UNDER-LINE, a town and parish of England, on the river Tame, in the county of Lancaster, in which considerable manufactures are carried on. Several villages are contained in this parish, the whole population of which amounts to 19,052. It is distant about 196 miles from London.

ASHUR, אֲשֻׁר, Heb. i. e. blessed, the son of Shem, and progenitor of the Assyrians.

ASH-WEDNESDAY, the first day of Lent, so called from the ancient custom of sprinkling ashes on the head.

ASHWELL (George), rector of Hanwell, son of Robert Ashwell of Harrow, was born at London in 1612, and admitted in Wadham College, Oxford, in 1627, where he took his degrees of A. M. and B. D. and was elected a fellow and tutor. During the rebellion he preached several times before the king and parliament. He died at Hanwell, in 1693, with the character of a religious, learned, and peaceable divine. He wrote, 1. A discourse, asserting the received authors, and authority of the Apostle's Creed. Oxon. 1653. 2. A double Appendix, touching the Athanasian and Nicene Creeds. 3. On the Gesture at receiving the Sacrament, 1663. 4. A Treatise concerning Socinus, and the Socinian Heresy. 5. A Dissertation on the Church of Rome. Ox. 1618. And an answer to Plato Redivivus; besides translations.

A S I A.

ASIA, in geography, one of the great divisions of the earth, lies to the east and south-east of Europe. North and south it stretches from about 2° to 77° of north latitude. East and west it extends from about 26° east, to 170° west longitude. Its northern capes penetrate the ice of the polar regions, while its southern promontories approach nearly to the centre of the torrid zone. Its greatest length in this direction is taken at something more than 5200 English miles from east to west. The extent of this continent from the western shores of Natolia, to East Cape in Siberia, has been calculated in a late popular work at 7580 miles.

BOUNDARIES.—It is bounded on the north and south by the Arctic and Indian Oceans; on the east by the Pacific Ocean and the Chinese Sea; and on the west by the Arabian gulf, the Isthmus of Suez, the Mediterranean, the Archipelago, the straits of Gallipoli, the sea of Marmora, the Bosphorus, and the Black Sea, whence to the Arctic Ocean the boundary which separates Asia from the east of Europe is not distinctly ascertained. It is, however, supposed to be constituted by the rivers Don and the Karsposca, one of its tributary streams rising near Sarepta, the course of which is to be continued by an imaginary line between the 40° th and 50° th of east longitude.

ISLANDS.—The islands belonging to Asia are the Prince's Islands near Constantinople, Mitylene, Scio, Samos, Cos, Rhodes, Cyprus, &c. in the Archipelago. Bahrein on the Arabian side of the Persian gulf noted for its pearl fishery. The Laccadive, Maldives islands, and Ceylon in the Indian Ocean, contiguous to the peninsula of Hindostan. East of the Bay of Bengal lies the Indian Archipelago, consisting of numerous different groups of islands including the Andaman and Nicobar islands, the Sunda isles, Sumatra, Java, and Borneo; the Moluccas or Spice islands, Papua or New Guinea, Solomon's isles, Queen Charlotte's isles, and the New Hebrides; which bending in a circular direction to the south-east lead us to the two islands of New Zealand. New Holland, to the south of New Guinea, is the largest island in the world, and contains an area larger than all Europe. East of the New Hebrides lie the South Sea islands. North of New Guinea are the New Carolinas and the Marianna or Ladron islands. West of them are the Manillas or Philippine islands, and the Mindanas or Magindanas north of the Moluccas. Immediately above Luzon is the Isle of Formosa. East of Formosa in the Chinese sea lie the Liü-Kieu, or Lütschü islands. Still farther northward we have Nison and other islands which together form the kingdom of Japan; from which proceed the Kuriles, consisting of numerous groups of little islands, extending in a chain from the isles of Japan to Cape Lopatka, the southern extremity of Kamtschatka. West of these on the coast of Tartary lie Saghalien and other islands. A little distant from Kamtschatka are the Aleutian or Fox islands,

proceeding in a curved line to the opposite extremity of America. Nova Zembla is also by some geographers considered as an Asiatic island, and lies to the north-west of Siberia. The islands of Itamisseram and Manar are curiously connected by a singular ridge of rocks called Adam's Bridge. It is nevertheless proper to observe that the best of later geographers, concurring in the opinion of the learned president des Brosses, have separated a vast number of the islands, formerly considered as Asiatic islands, from that continent, and arranged them with a number of other countries and islands to the south of Asia, and in the Pacific Ocean, under the two divisions of Australasia and Polynesia. The grounds of the new arrangement are explained with sufficient clearness by Mr. Pinkerton in his introductory observations on the Asiatic islands.

SEAS AND WATERS.—Besides the great oceans which wash three sides of this celebrated quarter of the globe, there are numerous gulfs, bays, and inland seas which have greatly contributed to its fertility and population. The Red sea or Arabian gulf, called the Weedy sea by the Hebrews, forms the grand natural division between Asia and Africa. Its length calculated from the straits of Babelmandel to the isthmus of Suez, is about 1470 English miles, and its medial breadth 140 miles. It terminates at the upper extremity, in two great branches, of which the western, by several miles the longer, is celebrated for the passage of the Israelites in the month Nisan, B. C. 1497, supposed to have taken place in about $29^{\circ} 40'$ north latitude. The eastern branch extends a little above the parallel of Mount Sinai. The Arabian sea is an appellation applied to the vast bay, included between Arabia and Hindostan, terminating in the Persian gulf, to which it is united by a strait twenty-four miles wide. This gulf stretches to the north-west between Arabia and Persia, containing several islands, and terminates under the same meridian as the Caspian. The deep and extensive Bay of Bengal, spreading from the eastern coast of Hindostan to the opposite shores of the Burman Empire, is separated from the last mentioned sea by the great promontory of the Deccan. This bay forms a magnificent inlet to the central part of southern Asia. At its entrance, which is in the eighth degree of latitude, it exceeds 1300 miles in width, and is 1000 miles from that parallel to its northern extremity, beyond the mouth of the Ganges. The gulf of Siam, on the opposite side of the peninsula of Malacea, separates the territorial projection from the broad rectangular peninsula included in the southern part of the Burman empire. The gulf of Tonquin lies on the south of China; the Yellow sea between China Proper and the gulf of Corea. The straits of Corea eastward lead to the sea of Japan; which stretches through about fifteen degrees of latitude, and divides the Japanese islands from the shores of the continent. This sea decreasing to the north terminates in a channel

leading to the sea of Okotsk which forms a spacious inlet to the south-eastern shores of Siberia, dividing Chinese Tartary from the peninsula of Kamtschatka. From the top of this sea projects a large forked gulf through nearly three degrees of latitude between two chains of magnificent mountains; one on the peninsula and the other on the continent. This gulf, and a bay on the opposite shore, render the conformation of the north-eastern part of Asia, peninsular. The sea of Anadir a few degrees south of Behring's strait forms another inlet to the north-eastern extremity of this continent. A few deep inlets are found on the shores of the Arctic Ocean. Passing from the White sea through the strait of Waygat, between Nova Zembla and the continent, we enter the gulf of Kara, which is divided from the deep gulf of Oby, by a long peninsula. This forms a large opening reaching nearly to the sixty-fifth parallel. The river Yenisei eastward forms itself into a wide estuary before it falls into the sea. The Bay of Tainourskaria, which from its situation is sometimes called the North Gulf, is placed about the seventy-fifth degree of latitude near the northern extremity of the Old World. Numerous other inlets are found along the coast from this point to Behring's strait. The Levant and the Archipelago lie on the western side of Asia, north of the Isthmus of Suez. The Euxine, or Black sea, forms the northern boundary of Anatolia, and is considered for the most part as a detached sea, being united to the Mediterranean only by a small strait, the Bosphorus of the ancients, so narrow as to be called the Canal of Constantinople.

The sea of Marmora, or Propontis, is considered by some an inland sea, and is connected with the Aegean Sea, or Mediterranean Archipelago, by a similar strait called the Dardanelles, or ancient Hellespont. This sea, as well as the Black Sea and Mediterranean, is supposed to have been anciently detached. The Caspian, celebrated for its fisheries, forms the separating boundary, which divides Russia from Persia and independent Tartary. It is of elliptical figure; the major axis extending nearly 700 miles from north to south, and occupying a breadth of nearly 200 geographical miles. It appears to have extended much farther north than it does at present; especially as the deserts in that direction are saline, and sandy, presenting the same kind of shells and marine productions as are found in the waters of the Caspian. Pliny and Strabo supposed this sea to be a gulf of the northern ocean; but it must always have been restricted by the western branch of the Uralian mountains, which passes to the north of Orenburg, reaching to the Volga. Its former union with the Lake Aral is highly probable from the marine deposits found in the intervening steppes, and from the Salt Lake still remaining between them; the midway eminence having been occasioned perhaps by the alluvion from the great rivers which flow into the latter. The Caspian is remarkable for its having no visible outlet for the discharge of its waters, notwithstanding the large rivers that flow into it, and also from the evidences of a former superior elevation being visible in the flanks of the moun-

tains forming its western coasts. M. Pallas imagined he recognised its ancient shores on the steppe, considerably higher than its present level; and has given some particulars on the subject. M. M. Engelhardt and Parrot, naturalists from Prussia, who visited this sea in 1815, place the former shores of the Caspian about 350 feet higher than its present surface; where they found gulfs and bays clearly defined. Its islands are mostly uninhabited; its bed is uneven, abounding with shoals, between some of which a line of 450 fathoms has been unsuccessfully employed to reach the bottom. Its waters are less salt than those of the ocean; but have a peculiar bitter taste. It has no tides; but is subject to violent storms. The striking peculiarity of this sea is the difference between its level and that of the Baltic and the Black Sea. From barometrical observations made at Astracan, and at St. Petersburg, during a period of nine years, the Caspian appeared to be 306 feet below that of the Baltic: and from other barometrical observations, made between the mouth of the Kuban and that of the Terck, the surface of the Black Sea was found to be 105 metres, or 344.5 feet above the Caspian.

Lake Aral is about 200 miles in length, and seventy in breadth, and about an hundred miles distant from the eastern shores of the Caspian; which, in some respects, it may be said to resemble: it extends in the same direction, and receives the waters of several rivers, but discharges none. The principal rivers that run into it are the Gibon, or Jilou; the Oxus, of antiquity, which enters the southern extremity; the ancient Jaxartes, which reaches it from the east; as also the Aujany, or Kizil Daria. The southern extremity of this lake is sprinkled with numerous islands; and its supplies of water flowing from the south and the east, while those of the Caspian flow from the north and west, evince that they occupy part of the same natural basin. Baikal, another of the great lakes, or inland seas, of Asia, is situated near the southern borders of Siberia, on the northern side of the great chain of mountains which divides that country from Mongolia. This lake, like the former, stretches in the same direction as the Caspian: is 350 miles in length, and nearly forty in breadth. Its waters are fresh and pellucid, presenting however the general appearance of a slight green tinge, and are usually frozen from the beginning of December to the end of April. The depth of this lake varies from twenty to ninety fathoms; but so clear are the waters, that the bottom becomes distinctly visible to the depth of fifty feet. It is subject to violent storms, and is often agitated without any visible cause; whence it has received from the Russians the superstitious name of *Svetoe Mare*, *Holy Sea*. This lake, although it receives the waters of several copious rivers, has no visible outlet except the lower Angara, the discharge from which is considerably inferior to the accessions which it receives. It is almost surrounded by mountains, in which the existence of subterraneous fire is evident, from frequent shocks of earthquakes; and the surrounding shores are distinguished by some remarkable phenomena.

It has been imagined by many geographers that the northern regions of Asia communicate with the continent of America. This however is a topic on which we have not sufficient data to ground an opinion. Captain Cook certainly traced the separation of these continents, partially: The best information yet obtained on this particular is, that Behring's Strait divides them to about forty miles in breadth, having East Cape on the Asiatic side, and Prince of Wales Cape on the American. The depth of water is about thirty fathoms. Pursuing this strait northward, the Asiatic shore tends rapidly to the west, while the American proceeds nearly due north; till, at the distance of four or five degrees, the two continents are joined by one solid and impenetrable mass of ice.

MOUNTAINS.—The mountains of Asia have always been thought remarkable; and, arrayed in all the horrors of perpetual winter, seem to frown in awful silence over the profusion of the vale.

A celebrated writer (M. Walckenaer, in his *Cosmologie*, p. 105,) observes, ‘that the chain of mountains in which the culminating points of the highest level are found, always follows the direction of the greatest dimensions of the continent; and the inferior chains or heights, where we find the culminating points of the second or third-rate levels, also follow the direction of the greatest dilatations of the land, terminating that continent.’ In Asia we have an illustration of these observations. The greatest dimensions of the continent are from east to west: and the country from the seventieth to the 100th degree of east longitude, and from the thirtieth to the fiftieth of south latitude, presents nearly a level area, from the different sides of which all the largest rivers flow into the sea. The culminating points of this extensive level, there is reason to believe, are the most elevated spots on the surface of the earth. The included area has been termed the table-land of Asia; although, since the revival of science, it has been inaccessible to European travellers, and therefore little known. The western part of it is, however, mountainous; and the eastern is a vast desert; the Shamo of the Chinese, and the Kobi of the Tartars, exhibiting an extent of several thousand miles not watered by a single stream.

The Altaiān mountains are the northern boundaries of this area; the Himálaya, on the south, divide it from Hindostan. On the east is that lofty range in which originates the great rivers of China; and the west is bordered by the mountains which contain the sources of the Indus and Jaxartes. The inferior chains, diverging as radii from this centre, are Múz-dágh or Múz-zárt, ‘snowy mountains,’ on the north. The Tibetan mountains on the east, the Vind'hyā hills and G'hats on the south, and the Alburg or Alborg on the west. The different ranges that traverse the territories of Persia, and unite its north-west provinces to Caucasus on the north, to Taurus and Libanus on the west and south, are connected with the Alburiān chain. Libanus is also connected by the hilly country on the west of Jordan with the mountains of Arabia. The greater number of these inferior chains run from east to west, in the same direction as the central range.

The extensive Altai, or Khattai chain, stretches across the continent, under different names, for more than 5000 miles, terminating, to the east, in Tchutskoi Ness and cape Lopatka. Of the highest points of this celebrated chain south of Russia, we have no accurate information; but the inferior ranges reach far above the point of perpetual congelation, and are supposed to be equal to the Alps. The Himálaya chain of mountains south of the great central level, rears its loftiest summits 26,000 feet above the level of the sea; and, according to some of our best geographers, upwards of 6000 feet above the celebrated Chimborazo of America, which towers over the entire Cordillera of the Andes. This southern chain is supposed to be of superior elevation to the northern. Mount Kailás, the Olympus of the Hindus, is supposed to exceed even the D'holá-giri in Nipal, which has been proved by admeasurements to reach 26,400 feet above the level of the sea. Mount Caucasus, the next in point of altitude, is a vast range extending between the Euxine and Caspian seas. Mount Ararat rises southwest of the Caucasus; Libanus, Amanus, and Taurus, are all connected with this great chain; and the latter mount diverging with various branches, occupies almost the whole area from the Euphrates to the sea of Marmora. The Uralian mountains, running from south to north, nearly as far as Nova Zembla, and called by the Tartars the girdle of the earth, are much colder, in consequence of a higher latitude; but are inferior to the above in point of elevation.

Many volcanoes are in a constant state of activity throughout Asia; and many which were volcanic in former times, are now extinct, although smoke still issues, and hot streams are frequently discharged from crevices in their sides. The insular regions of Asia are likewise mountainous, and Adam's Peak, in Ceylon, has been a remarkable subject of tradition and fable. Volcanoes are also found in most of the Asiatic islands; Gunong-api is one of the most active now known; of that near Brambanan, in Java, a violent eruption is recorded in 1586. Tername, the chief of the Moluccas, is nothing more than a volcanic cone, occasionally emitting flames from its summit; and on its sides are large pits of melting sulphur. The isles of France and Bourbon are entirely of volcanic origin; and the crater of the latter, while in a state of eruption, was visited by M. Bory de St. Vincent, who describes, with great interest, the phenomena observed on that occasion.

RIVERS.—From the mountains of Asia numerous rivers descend, which serve greatly to refresh the surrounding country. The river Lena rises east of Siberia, near the lake Baikel, and flowing first north-east, then north, enters the Frozen Ocean, opposite the Borkhaya isles, after a course of 1900 miles. The river Enisei, rising in the Altaiān mountains, flows into the same sea after a course of at least 1400 miles. The Oby, perhaps the widest river in the Russian empire, rises about 51° north latitude, and 87° east longitude from the Altúrnor of the Kalmaks, and Ozero Teletzkoï of the Russians; and after a course of not less than 2000 miles, falls into the Obskaya Juba, or sea of Oby, within the arctic circle. The

river Irtish takes its rise in 46° north latitude, and 92° east longitude, in the northern barrier of the central plateau; and after rolling its rapid stream as far as the 62° degree of latitude, and gathering numerous tributary waters in its course, falls into the river Obe, north of Samarou. The Amour, or Saghalia, which rises in the Kalcas country, is formed by the junction of the two rivers, Kerton and Argun; and after traversing Chinese Tartary, and receiving several large rivers in its course, disembogues itself in the sea of Okhotsk, near the northern extremity of the channel of Tartary, completing a course of 1800 miles. The rivers of China chiefly rise in the eastern declivity of the Table Land. The Méking, or Kambója, and the Irawadi, or Ava River, after descending from the plateau into the lower country by long and winding courses, flows in a direct line to the Indian Ocean. The three most celebrated rivers that spring from this region are the Indus, Ganges, and Burrampooter. The Ganges river is held sacred by the inhabitants, and is the only one of the three of whose source we have any satisfactory information; although Moorcroft tells us he found that of the Indus in $31^{\circ} 3'$ north latitude, and $80^{\circ} 35'$ east longitude. The two others rise in Thibet; the Burrampooter waters the eastern parts of ~~Lung~~, and the course of the Indus, to the south, has been known ever since the time of Alexander. The Oxus and the Jaxartes are two large streams, well known to the ancients, which rise from the western declivity of the central range; the former emanating from the glaciers of Pushti-khur, is supposed anciently to have taken a north-westerly course; at present it proceeds almost due north, and falls into the lake Aral. The latter rises in the Belúrdágh or Icy mountains, west of Afgháunistán, and enters the eastern side of the same lake. The Tigris and Euphrates flow to the south, and the Araxes to the east, watering a considerable extent of country. The Jordan and Orontes fertilize and beautify the vales of Syria and Palestine. Anatolia, though it has neither broad nor rapid rivers, is refreshed by the division of innumerable smaller streams, which throw an enchanting appearance over the surface of the landscape. The Haly, or Kizil Irma, arising from mount Taurus, after a course of 350 miles, falls into the Black Sea. But the Howang-ho, or Yellow River, which waters the northern provinces of China, is perhaps the deepest and most rapid river of Asia. This river rises on the eastern declivity of the plateau, and rolls its vast stream with unabated rapidity, to nearly 2000 miles. The Yang-tse-kiang, or son of the sea, is another noble stream of China.

CLIMATE.—The climate of Asia is exceedingly various, owing to the different degrees of elevation. In the south-east the heat is excessive, and in the northern parts the cold is almost insupportable. In Anatolia the central parts are colder than the provinces of France, although the latter are ten degrees farther north. The cause of this is explained by Mr. Brown, who calculates that the city of Erz-rüm is 7000 feet above the level of the sea. This extraordinary altitude of level, together with the great body of snow on the neighbouring mountains, accounts for the

extremes of cold in Persia and Tartary; Arabia is considerably tempered, though within the tropics. China being mountainous has an agreeable climate; while in India and the Burman empire, are sensibly experienced the full effects of a torrid zone.

VEGETABLES.—The stupendous mountains, immense plains, immeasurable forests, noble rivers, and wide spreading marshes of this quarter of the earth, together with the variety of the soils, and an extreme difference of climate, from the intense cold of Siberia, where mercury freezes, to the almost insupportable heat of the sandy deserts: from the eternal frost that reigns around the pole, to the sterility of the arid waste, including diversified intermediate regions, always adorned with the blossoms of spring, enriched with the fullness of summer, or laden with the productions of autumn, produce an unparalleled variety of vegetation, from the almost imperceptible moss that creeps along the Arctic shores to the hundred-stemmed banyan that spreads its beautiful luxuriance beneath a tropical clime. Some parts of Asia are very sterile, and the inhabitants look for support to the surrounding sea, in which fishes and mollusca abound. Vegetable productions however, generally speaking, are numerous, and differ according to the climate under equal circumstances of soil and irrigation. The central and western parts produce all sorts of grain which are common in Europe, and culinary vegetables in the highest perfection. The tropical and southern regions afford gums, spices, medicinal roots, and extracts unknown in colder climates. Several genera of plants are peculiar to New Holland and the adjacent islands. The tea-tree is found chiefly in the central regions; and the bread fruit and bamboo, which are natives of Asia, are useful in every part of domestic economy.

MINERALS.—This division of the globe contains the precious metals in great abundance: gold is washed down the rivers of Asia Minor. Arabia still supplies it in its utmost purity; and in Assam, Celebes, and Borneo, the gold is said to be native. Mount Sipyhus has been celebrated for the production of silver, and the mines of Tokat supply both silver and copper. Great quantities of tin are found in the island of Bauca; lead and iron in various parts of the continent; precious stones are found in great variety throughout the whole of Asia; fine diamonds in Golconda; rubies in Ceylon, topazes in Siberia; and the most beautiful pearls in the straits of Manaar and the Bahrain islands; the corundum and other valuable stones are peculiar to these countries. Singular remains of antiquity are also dug out of the earth; huge tusks of a species of animal now unknown, and even the entire animal itself, is found in the islands of the Frozen Ocean.

ANIMALS.—Asia contains a great variety of land and marine animals, from the minute insect that flutters in the solar beam, to the stupendous elephant, the ferocious tiger and the majestic lion. The most valuable are indigenous to this quarter of the globe. The horse is found on the northern confines of Persia in his native state,

but exhibits none of the symmetry, powers, or proportions, to which he arrives through a course of domestic training. The camel is found here in his most perfect growth, and performs journeys which to the horse would be fatal. The elephant is trained to all sorts of service. The sea-otter, so valuable for his fur, and the whale are common, and supply a considerable source of wealth to the inhabitants.

'The population of Asia,' it has been observed, 'by no means equals those expectations which its history would naturally inspire,' owing to the ravages of war, and the influence of despotic governments, which always impose an effectual check upon the increase of population. Nevertheless, where the governments are mild and beneficial, as in British India, the reverse is the fact. China in particular, owing to a long freedom from foreign and domestic war, is said to exhibit the amazing population of five hundred millions; and even this, according to some geographers, is below the real amount.

Asia, however, being the scene of human origination, is still peopled by numerous indigenous tribes, and presents an ample field for the study of man, in all the stages of his progress from barbarism to civilisation. The variety observed in the appearance of the natives is probably the effect of difference of climate, aliment, and religion. The Samoied tribes, New Hollanders, and inhabitants of Andaman, are of diminutive size. The people of Jesso and the Kurile islands, have uncommonly large beards, and an unnatural profusion of hair all over their bodies. The Tartars and Chinese are known by the peculiar figure of their faces; the latter particularly by their oblique contracted eyes. There is, however, reason to believe they were anciently derived from one common origin, and bore a great resemblance to each other.

HISTORY.—Noah is said to have settled in Asia, immediately after the deluge, near the borders of the Euphrates, and to have peopled the whole continent. The posterity of Shem occupying the central regions; Japhet the northern; and Ham the southern. Javan and his descendants, Ashkenaz, Dodanim, Tarshish, Elisha, Togernah, and Riphath, are supposed to have been the ancient inhabitants of Asia Minor. The Canaanites and Amalekites were the people of Syria and Arabia Petrea. Modern writers have referred the present natives of Asia to those different stocks the Hebrews, Indians, and Tartars, the propriety of which will appear from their make, features, and languages. There are, however, some large tribes, as the Malays and aboriginal negroes, which cannot be referred to either of these classes, as also the mountaineers of Caucasus, and the inhabitants of northern Siberia. Mr. Pinkerton observes, that the population of Asia is allowed by all authors to be wholly primitive and original; with the exception of the Tshuktschis, whom the Russian historians suppose to have passed from the opposite coast of America, the colonies that have migrated from Russia to the northern parts as far as the sea of Kamtschatka, the well-known European settlements, and a few others. Asia certainly presents an amazing original population. We add the following table of

the nations and languages in Asia, as calculated to give the reader a tolerably accurate idea of this interesting subject of enquiry.

Table of the Nations and Languages in Asia.

1. Assyrians.—Assyrians, Arabians, Egyptians.—Chaldee, Hebrew, &c.
2. Scythians.—Persians, Scythians intra et extra Imaum, &c. Armenians.—(The Parsi and Zend are cognate with the Gothic, Greek, Latin, according to Sir William Jones. Indian Dissert. vol. i. p. 206. The Pehlavi is Assyrian or Chaldaic. *Id.* 187, 188, 206.)
3. Sarmats.—Medes and Parthians.—Georgians and Circassians.
4. Seres and Indi.—Hindoos, northern et southern, &c.
5. Sinae.—Chinese and Japanese.—These have a Tartaric form and face; they are probably highly-civilised Tartars, Mongoles, or Mandshurs.

Barbaric Nations from north to south, and according to the degrees of barbarism.

6. Samoyedes, Ostiaks, Yurals, &c.
7. Yakutes.—Yukagirs. (Expelled Tartars, according to Tooke and Lesseps.)
8. Koriaks.—Tshuktschis. (From the opposite coast of America. Tooke's Russia. The Yukagirs are a tribe of the Yakutes, around Yakutsk, and both are expelled Tartars. Tooke's View, ii. 80. Lesseps, ii. 312.)
9. Kamtschatales.—Kurillans.—(These resemble the Japanese.)
10. Mandshures or Tunguses.—Iamutes.—(Ruling people in China.)
11. Mongoles.—Talmuks.—Soongares, Tungutes, Burats, &c.
12. Tartars or Huns.—Turks, Khasares, Uzes, and Siberians.—Nogays, Bashkirs, Kirghiseikai-zaki or Kirghise Kaizaks, Teleutes.

After the destruction of Attila's swarms, and the effects of unfortunate inroads, the Huns became subject to the Mongoles, who under Zingis, or Chingis khan, Timur, &c. constituted the supreme nation in Asia.

The great share of population which Europe has received from Asia will appear from the following brief statement.

Primitive Inhabitants.

1. Celts.—Irish, Welsh, Armorican.—Erse, Manks, Cornish.
2. Fins (chief god Yummala).—Finlanders, Estonians, Laplanders, Hungarians, Permians or Biarmians, Livonians, Votiaks and Chermissons, Vogules and Ostiaks.

Colonies from Asia.

3. Scythians or Goths (Odin).—Icelanders, Norwegians, Swedes, Danes, Germans, English.—Swiss, Frisic, Flemish, Dutch.

4. Sarmats or Slavons (Perune).—Poles, Russians, Kaizaks.—Heruli, Vendi, Lettes.

The inhabitants of France, Italy, and Spain, are also of Asiatic origin; and speak corrupted Roman, which, like the Greek, is a polished dialect of the Gothic, according to Sir William Jones, and other able antiquaries. The Heruli

Vendes, and Lettes, used mixed and imperfect dialects of the Sclavonic.

Besides these numerous original nations, the Malays and Asiatic islanders constitute another large and distinct class of mankind, with a peculiar speech, in the south of the extensive continent of Asia.

GOVERNMENTS.—The people of Asia in their civil state consist of families occupying the same territory, but acknowledging no chief or governor; of independent tribes associated under one common potentate as the Arabs and Tartars, and therefore called equestrian nations; or of kingdoms ranged under established monarchies, of which the chief are Independent Tartary, China, Thibet, with its subsidiary provinces, the Japanese empire, &c. The Asiatic governments are mostly despotic, and those established by Europeans are nearly of the same description. In some of the political institutions of Asia there is, however, the rude image of a popular administration; in others the influence of women is admitted; whilst in some few the prince is guided in all public measures by the advice of his nobles. Were the principal governments in Asia to be arranged according to their natural and political importance, they would probably succeed each other in the following order: China in the first place, and after this successively Persia, Turkey, and Russia; the precedence of the numerous other states can hardly be ascertained.

RELIGION.—The most common religion of Asia is idolatry. The doctrines of Mahomet prevail to a great extent; but their influence is upon the decline, owing in a great measure to the popularity of the Wahabees. Christianity is now generally rejected in Asia, and in many countries even where it was formerly tolerated, as in China and Japan. The sacrifice of animals, and even of human victims, is very frequent; and a spirit of the most degrading superstition seems to reign throughout the vast regions of this division of the globe. Penance is carried beyond even the bounds of probability. Imposing upon himself perpetual silence, gazing on the sun till his eyes become fixed in their sockets, lacerating his body with sharp weapons, and other practices still more shocking to humanity are, through vast regions, considered among the most acceptable services which a man can offer to the deity. Polygamy is generally practised, and sometimes even a plurality of husbands are allowed to a single woman: females of rank also, betrothed at an early age, cohabit not with their husbands but with other men without reproach. Infanticide is common; and burning the living wife with the body of her dead husband, though now rendered a voluntary act on the part of the woman, has by no means subsided. Many of the tribes are complete cannibals, and others are little better.

CHARACTER OF INHABITANTS.—The inhabitants of Asia, violent in their dispositions, are generally ferocious, vindictive, and cruel. The tender ties of nature are little felt. Children are openly sold by their parents without even the apology of necessity. Wives are sacrificed by their husbands even on the bare suspicion of infidelity; and in the most civilised state after an

unfortunate contest for the crown, the unsuccessful prince, if not executed, invariably has his eyes put out, though the rival should be his own brother.

The ancient geography of Asia cannot be contemplated without feelings of excitement, which the deep gloom of her present degraded and idolatrous condition are unable to suppress; feelings unknown in the contemplation of any other portion of the globe. Asia was the parent of nations, the cradle of civilisation and science—here occurred most of those remarkable transactions recorded in the scripture history—here arose successively the Babylonian, Assyrian, and Persian empires—and here the Christian religion was first planted for the salvation of man. Much of the celebrity of this quarter of the globe is undoubtedly owing to its climate, and the numerous gulfs, bays, and navigable rivers with which it abounds opening early facilities for commerce, &c.; but still more perhaps is to be attributed to the native genius and sanguine temperament of its inhabitants.

The origin of the name of Asia has given rise to some curious speculations and disquisitions. The Greeks deduced it from Asia, the fabulous daughter of Oceanus and Thetis. Others have derived it from Asius, king of Lydia. Bochart traces it to the Hebrew or Phœnician word Asi, signifying middle, which is, however, unsupported by historical evidence. According to Homer, Herodotus and Euripides, it early designated a country of Lydia, where ancient geography mentions a tribe of Asiones and a city of Asia. The name, however, was gradually extended by the Greeks from a single province to the whole of Asia Minor, and afterwards to other regions as they were discovered successively; in the same manner as Allemagne is applied by the French to the whole of Germany; and as Italia, an ancient canton in Calabria, is now denominated the peninsula of Italy. Since, however, much perplexity has arisen among authors by the diverse acceptations of the term Asia, so as to render it extremely difficult for their readers to know what region was distinctly understood by that appellation; and since it is not easy to reconcile the apparent inconsistency between sacred and profane history, as to the provinces which it comprised, we present the following observations for the satisfaction of the reader:—The ancient geographers divided the vast continent that was known to the Greeks and Romans under the word Asia, first into Greater and Lesser Asia. The latter, also called Asia Minor, was thought to be a peninsula terminated by a line drawn from Sinope to the line of separation between highland and lowland Cilicia (Aspera and Campestris). It comprehended a great number of provinces; but that which included Phrygia, Mysia, Caria, and Lydia, was denominated Asia Proper, or Asia properly so called. Cicero, enumerating the regions contained in Asia Proper, makes no mention of Æolis or Iolia, though undoubtedly a district of it, as being comprehended partly in Lydia and partly in Mysia. Lydia, beside the inland country commonly known by that name, contained also Ionia, lying on the sea-side, between the rivers Hermus and

Mæander; and Æolis, extending from Hermus to the river Caicus, or to the promontory Leuctrum, the ancient boundary between Troas and the sea-coast of the Greater Mysia. Accordingly, Asia Proper comprehended Phrygia, Mysia, Lydia, Caria, Æolia, and Ionia. This tract was bounded, according to Ptolemy, on the north by Bithynia and Pontus, extending from Galatia to Propontis; on the east by Galatia, Pamphylia, and Lycia; on the south by part of Lycia and the Rhodian sea; on the west by the Hellestont, by the Ægean, Scarian, and Myrtoan seas, occupying the space between the thirty-fifth and forty-first degree of north latitude, and extending from 55° to 62° of longitude.

As Asia Proper is but a part of Asia Minor, so the Lydian Asia is only a part of Asia Proper. Asia, in this acceptation, comprehends Lydia, Æolia, and Ionia; and is that Asia whereof mention is made in the Acts and the Apocalypse. Aristotle tells us that Smyrna was at first possessed by the Lydians; and Scylax Coryandensis reckons it among the cities of Lydia, as also Ephesus, Sardis, Philadelphia, and Thyatira, are reckoned by Ptolemy among the cities of Lydia, as is Laodicea by Stephanus. Steph. de Urbid. That in ancient times Lydia was called Mæonia, and the Lydians, Mæonians, is manifest from Herodotus, Diodorus Siculus, Dionysius Afer, Strabo, Pliny, Stephanus, and others; and that Mæonia was called Asia is no less plain from Callinicus, who flourished before Archilocheus, from Demetrius Seepsius, contemporary with Crates, and Aristarchus the grammarian, from Euripides, Suidas the great etymologist, &c.; besides which it is expressly affirmed by the ancient scholiast of Apollonius Rhodius, that Lydia was formerly called Asia, and hence Lydia has been said to have a better claim to the name of Asia than any other part of that continent. Ulterior (or Greater) Asia comprehended the remaining part of that continent. Its great divisions were Iberia, Colchis, and Albania, between the Euxine and Caspian seas; Mingrelia, Georgia, and Daghستان Armenia, which retains its ancient name. Media and Persia included in modern Persia. Bactriana and Margiana; the Merri, Balkh, and Bokhāra of the Turks and Tartars; Syria, Mesopotamia and Assyria, the Bilādu'sh išhām, Diyar bek̄r, and Abjonirah of the moderns. Hyrcania, Persia, and Susiana, the Irāk and Fārs of the present day. Judea, Babylonia, and Chaldea; the southern part of Syria and Pachalic of Bagdad. India the country between the Indus and Ganges, and Syria the remoter regions to the north-east.

ANCIENT GEOGRAPHY.—The earliest accounts of this vast portion of the globe are those contained in the Scripture, which are, however, extremely imperfect. Moses has enumerated the different parts of the earth with which the Hebrews were familiar; but, in consequence of the names by which he designates the places differing from other authors, great obscurity hangs over the whole of his geography, except that which relates to the land of Canaan itself, and the states immediately contiguous. He appears to have been well acquainted with Asia Minor, Armenia, Media, Persia, and Arabia. The Gor-

and Magog of Scripture seem to have been the inhabitants of Caucasus. Riphath seems to refer to the Riphæan mountains; and Rosh refers to the ancient Rossi, from whom were descended the Russians of the present day. The more northerly parts of Asia were evidently unknown to the Greeks. Herodotus considered the Phasis in Colchis as the line of separation between Europe and Asia, whilst others believed the Don, or Tanais, as the proper limit. The mountains north of India were the utmost boundary of their knowledge with respect to that part of Asia. The Ganges and the Indian Ocean they considered the eastern and southern limits; and the Red Sea, with the isthmus between it and the Mediterranean, brought them back to the western or nearest side. Many geographers included Egypt in Asia, making the Catabathmus, or western side of the valley of the Nile, the separation between Asia and Africa; whilst others considered the Nile itself as the line of separation. Strabo and Pliny supposed the northern end of the Caspian sea communicated with the ocean.

PROGRESSIVE GEOGRAPHY.—At the time when Asia was first mentioned in history it probably contained more powerful empires than it does at present, ~~the Chinese excepted~~. Alexander the Great carried his arms beyond the Indus. The Siuæ, or eastern Indians, were known to Ptolemy in the second century, and also Taprobane or Ceylon, with Jabadia, the Java dwipa of the Indians, and the Java of our maps. Alfred, king of England, deputed a mission to the shrine of St. Thomas on the coast of Babelmandel; and the crusades of Syria and Palestine, in the eleventh and twelfth centuries, led to an intimate acquaintance with that part of Asia. Shortly after the passion for crusades had subsided, a spirit of commercial enterprise was excited, and merchants, from several parts of Europe, penetrated into the interior. The monks, animated with a desire to convert the heretics, departed in great numbers for Asia; a mission deputed from the pope to the court of the Moguls, and another from Louis of France to the same princes contributed on their return, by the publication of their travels, to enlarge the ideas of Europeans with respect to that part of the world. Marco Polo, a Venetian merchant, with his companions, spent twenty-six years in travelling either as merchants, or as agents of the Great Khan of the Tartars, during which period they for the first time disclosed the great desert of Cobi, and made great additions to our knowledge of oriental geography, particularly in the north of Asia. Such indeed was the ignorance of the age in which he lived, that his descriptions of the magnificence and wealth of the Asiatics were regarded by his contemporaries as the effusions of romance. Subsequent information has nevertheless raised him to distinguished credit, and his work is now considered one of the most curious monuments we possess of the state of Europe and Asia in the middle ages. In the fifteenth century improvements in navigation, and the spirit of commercial enterprise, facilitated the progress of discovery. A passage was discovered to India round the Cape of Good Hope, and the

English, Dutch, Spanish, and Portuguese settled several establishments on the Asiatic coast, from which they undertook still more distant expeditions into the interior, and opened an intercourse with China, Japan, and Hindostan. The British government sent out repeated expeditions under the conduct of Cook, Byron, and others, to make discoveries in the Southern Ocean; and the empress Catharine about the same time directed scientific travellers to explore some of the central parts of her Asiatic dominions. Geography by these means received many splendid additions, and our knowledge of different and distant parts of the globe illustrated many important and interesting points in the physical and natural history of southern Asia. Van Diemen's Land and New Holland were explored by captain Flinders. The same voyager also observed that there is no river deeply penetrating into the latter island; and that the gulf of Carpentaria is a basin of vast extent studded with islands. The expulsion of the Dutch from their insular settlements has also led to an intimate acquaintance with those territories, all knowledge of which they endeavoured to conceal. Travellers from British India have greatly increased our information with respect to the neighbouring regions. A mission to the court of Persia has thrown a light on the geography and policy of that distinguished empire, and shown how defective our information was with regard to Oriental nations. A field of discovery, however, yet remains to complete the geography of this part of the world. The origin, course, and progressive increase of some of its greatest rivers are unknown; scarce any of its internal seas, except the Caspian, have been the subjects of actual survey; and its mountains, perhaps the most stupendous masses on the globe, present a wholly unexplored field of enquiry. Siberia is but little known; and even of the coasts no perfect survey has ever been taken. The whole extent of country from the Caspian to the sea of Okhosts, including a superficial area of many thousands of miles, is occupied by nations and people whose names are scarcely known. Little more than the borders of Arabia is known to Europeans. The interior regions of Tartary and the northern part of China require much illustration. The same remark may be applied to India and the interior of Asia generally. With regard to the probable population of this continent so defective is our knowledge that differences of between one and two hundred millions exist in regard to that of China alone. Our knowledge of the islands is almost equally imperfect. Not a tenth part of New Holland has been attempted, and that only in a single line, although every journey unfolds novelties and wonders in nature which seem to distinguish this extensive island from every other region in the world. Borneo, Sumatra, Celebes, and Papua greatly demand the attention of travellers. The north-eastern angle of territorial Asia has been repeatedly visited by navigators and travellers since the civilization of Russia by the genius of Peter the Great; but the geography and natural history of that region have been hitherto described in a manner which is exceedingly imperfect. On the whole we are

looking for superior lights. The morning which dawned so many centuries ago has hitherto advanced but slowly; and we hail the approach of a brighter period, which is not very remote, when the sun of discovery shall burst the clouds in which he has been enveloped, and irradiate the geography of this interesting section of the globe.

The propagation of Mahomedanism, and the exterminating wars by which it was attended, effected a complete revolution by the states of this continent. The Greek empire sunk in the arms of the victorious Moslems. The caliphs for a time prevailed to a considerable degree over their Constantinopolitan predecessors, and were in their turn humbled by the Tatarian Jengere and Témür. The latter were finally absorbed in the overwhelming power of the Turks who now, having no formidable enemy to oppose, overran the west of Asia, and in the middle of the fifteenth century extinguished the Eastern Empire, and laid the foundations of those great divisions of this continent which subsist at the present day.

With respect to the modern divisions of Asia, we observe that the Russian empire extends from the Uralian mountains to the sea of Kamtschaka, and from the Arctic Ocean to the parallel of fifty degrees north latitude. It is inhabited by Tartars, Mongols, Mantchirs, &c., under the general name of Siberia. The Asiatic part of the Ottoman Empire, consisting of Anatolia, Syria, and Diyar-Bekr, the ancient Mesopotamia, lies between the Black Sea and the Mediterranean; the canal of Constantinople and the Tigris; Arabia lies to the south of the latter country; and Persia lies east of the Tigris, as far as the Indus, between the Caspian Sea and the Persian Gulf. East of the Caspian, as far as east longitude 100 degrees, between Russia and Persia, are the independent Tartars. From the above meridian, to the Sea of Japan, lies eastern or Chinese Tartary, inhabited by the Mantchirs who subdued China in the middle of the seventeenth century, and whose original country forms at present the northern part of that empire. Thibet is on the north side of the Himalaya mountains, the Alps of Hindostan. South and east of China lies the peninsula of India, beyond the Ganges. West of the Burman empire is India on this side the Ganges, comprehending Kashmir, Hindostan, and the Deccan. The islands are under various governments, and have been made the seat of various commercial establishments by the different powers of Europe, of which an account will be given under their names separately.

ASIA MINOR is the western portion of Asia, having the Black Sea on the north, the Euphrates on the east, and the seas Mediterranean and Marmora, with the Hellespont and Bosphorus, on the west. It is of an irregularly oblong figure, 1000 miles from east to west, and 400 or 500 from north to south, variously indented by bays and inlets, and having a few peninsulas and promontories. Its streams and rivers are numerous but not large; the interior abounding with saline lakes, crystal fountains, and hot-springs, whose waters have been cele-

brated for their medicinal qualities. The climate is fine, and its valleys warm, washed in some places by mountain torrents, shaded by the mountains, and tempered by cool and refreshing breezes from the sea. Long ranges of hills, from which branches diverge in all directions, isolated rocks and mountains crowned with trees and verdure, delightfully change the prospect; while the luxuriance of the soil and abundance of grain, fruits, and every species of vegetation, render subsistence comfortable and happy. Earthquakes are, however, frequent, overwhelming entire cities and their inhabitants; and the plague sweeps away its thousands. The whole country is subject to the Turkish government, and inhabited chiefly by Mahomedans and Christians. It is divided into several large provinces, of which Natolia and Caramania are the most important. It contains

the cities of Angora, Bursa, Smyrna, and Tocat, besides the ruins of many others which have been highly celebrated in history. The southern shore of Caramania is overspread with remains of Grecian antiquities; and Natolia abounds with ancient curiosities and columns, having been the theatre of important events from the earliest history. The several islands in the Archipelago, belonging to this country, are also highly classical and important.

This part of Asia is the most interesting region of the earth, the parent of education, arts, and arms—the cradle of mythology, poetry, and eloquence—the favorite abode of the muses—the soil in which lay the ancient roots of genius, which have since struck round the world, beautified the moral wastes, and still luxuriantly expand their blossoms in almost every clime of the civilised globe.

ASIAGO, one of the seven Venetian communes in Upper Italy, in the midst of mountains, in the north of the circle of Vicenza, and now belonging to Austria. The inhabitants are descendants of the ancient Germans, and lead a purely pastoral life. They enjoyed great privileges under the Venetian government, and have more than once defended the passes of their country against the inroads of a foreign foe. The large town of Asiago is the seat of the court of justice for all the communes; has a castle, and 11,000 inhabitants. It is twenty miles north of Vicenza.

ASIDE. On side. See SIDE.

And he took him *aside* frō the people and putted his fingeris into hisis ecris and he spette and touchide hisis tongue. *Wyclif. Mark ch. vii.*

FRAN. Sir, he may live.

I saw him beat the surges under him,
And ride upon their backs; he trod the water,
Whose enmity he flung aside, and breasted
The surge most swoln that met him; his bold head
'Bove the contentious waves he kept, and oar'd
Himself with his good arms in lusty strokes
To the shore; that o'er his wave-worn basis bowed.

Shakspeare's Tempest.

Thus (she pursu'd) I discipline a son,
Whose uncheck'd fury to revenge would run;
He champs the bit, impatient of his loss,
And starts aside, and flounders at the cross.

Dryden's Hind and Panther.

It is the custom of the Mahometans, if they see any printed or written paper upon the ground, to take it up and lay it aside carefully, as not knowing but it may contain some piece of the Alcoran. *Addison.*

ASILUS, in entomology, the hornet-fly, a genus of insects belonging to the order of insecta diptera. It has two wings; and a horny, strait, two-valved, beak. There are seventeen species of this insect. Many of them wound in a very painful manner, and are particularly troublesome to cattle in low meadows; others of them are quite harmless.

ASILUS, in ornithology, the name used by many for the luteola, or regulus non cristatus, an extremely small bird, common among wiliows.

ASINARII, an appellation given, by *wes* of Vol. III.

reproach, to the ancient Christians, as well as Jews, from a mistaken opinion, amōng heathens, that they worshipped an ass.

ASINESIA, in medicine, an immovableness of the body, ~~any~~ any part of it, as in apoplexy, palsy, &c.

ASINIUS LAPIS, a name given by some writers of the middle ages, to a stone, said to be found in those places frequented by the wild ass. See BEZOAR.

ASINUS PISCIS, in ichthyology, a name given by some to the eglefinus, or common haddock, called also onos.

ASIO, in ornithology, a name given by Aldrovandus and others, to the otus, or lesser horn owl.

ASISIA, or **ASSISTIA**, a town of Liburnia, now in ruins, but exhibiting many monuments of antiquity. It is the Asseria or Assesia of Pliny, and is now called Podgraje. See ASSERIA.

ASISIO, or **ASITIO**, a city of the Pope's territories in Italy, situated about sixteen miles east of Perugia, and eighty north of Rome. It is seated on a mountain, and is said to have been the birth-place of St. Francis.

ASK, { Ang.-Sax. secan, ascecan, to seek,

ASKER, { to ask; ascean, to seek, to ask. To seek, enquire, demand, require, petition, beg.

As it is a great point of art, when our matter requires it, to enlarge and veer out all sail; so to take it in and contract it, is no less praise, when the argument doth ask it.

Ben Jonson.

A lump of ore, in the bottom of a mine, will be stirred by two men's strength; which, if you bring it to the top of the earth, will ask six men to stir it.

Bacon.

When thou dost ask me blessing, I'll kneel down,
And ask of thee forgiveness. *Shakespeare.*

We have nothing else to ask; but that,
Which you deny already: yet will ask;
That, if we fail in our request, the blame
May hang upon your hardness. *Id.*

In long journeys, ask your master leave to give ale
to the horses. *Swift.*

Let him pursue the promis'd Latian shore,

A short delay is all I ask him now;

A pause of grief, an interval of woe. *Dryden.*

F.

*Ask of the learn'd the way ; the learn'd are blind ;
This bids to serve, and that to shun mankind ;
Some place the bliss in action, some in ease,
Those call it pleasure, and contentment these.*

Pope. *Essay on Man.*

Upon my asking her who it was, she told me it was a very grave elderly gentleman, but that she did not know his name. Addison.

ASKAH, a town of Hindostan, in the northern circar, Cicacole, thirty-six miles north by west of Ganjam. It stands in N. lat. 19° 44', E. long. 84° 55'.

ASKANCE', Supposed to be from *as-*
askaunce', *chined*, participle of the Dutch
askaunt', *verb schuinen*, to cut awry.
Asquint'. From whence probably are
squint and asquint; sideways, oblique.

And wrote alway the names, as he stood,
Of alle folk that gave hem any good,
Askaunce that he wolde for hem preyne.

Chaucer. *The Sempnour's Tale.*

Some say, he bid his angels turn *askance*
The poles of earth, twice ten degrees and more,
From the sun's axle : they with labour push'd
Oblique the centric globe. Milton.

Zelmane, keeping a countenance *askance*, as she
understood him not, told him, it became her evil.

Sidney.

His wannish eyes upon them bent *askance* ;
And when he saw their labours well succeed,
He wept for rage, and threaten'd dire mischance.

Fairfax.

While thus their worke went on with lucky speed,
And reared rammes their horned fronts aduance,
The ancient foe to man, and mortall seed,
His wannish eyes vpon them bent *askance*.

Fairfax's *Tusso*, book iv.

At this Achilles roll'd his furious eyes,
Fix'd on the king *askaunt*; and thus replies,
O, impudent— Dryden.

Since the space, that lies on either side
The solar orb, is without limits wide ;
Grant, that the sun had happened to prefer
A seat *askaunt*, but one diameter :
Lost to the light by that unhappy place,
This globe had lain a frozen loansome mass.

Blackmore.

Through his bright disk the stormy weapon flew,
Transpierc'd his twisted mail, and from his side
Drove all the skin, but to his nobler parts
Found entrance none by Pallas turn'd *askance*.

Couper's *Iliad*, book xi. p. 195.

—Panic-fixed he stood,
His seven-fold shield behind his shoulder cast,
And hemm'd by numbers with his eyes *askant*,
Watchful retreated. Id. book xi.

ASKERON, a place five miles from Doncaster, noted for a medicinal spring. It is a strong sulphureous water, slightly impregnated with a purging salt. It is recommended internally and externally in strumous and other ulcers, scabs, leprosy, and similar complaints. It is good in chronic obstructions, in cases of worms, &c.

ASKEW'. Dan. *skjævt*, crooked; from *skjæver*, to twist.

For, when ye mildly look with lovely hue,
There is my soul with life and love inspir'd :

But, when ye lowre, or look on me *askew*,
Then do I die. Spenser.

Then take it, Sir, as it was writ ;
Nor look *askew*, at what it saith :

There's no petition in it. Prior.

This said, her spear she push'd against the ground,
And, mounting from it with an active bound,
Flew off to heaven : the hag with eyes *askew*
Look'd up, and mutter'd cursos as she flew.

Addison. *Ovid's Met.* book ii.

ASKEW (Anne), an English lady, the daughter of Sir William Askew, of Kelsay, in Lincolnshire. She was born at her father's seat about 1520; and received a liberal education. Early in life she was married to a Mr. Kyme, contrary to her own inclination; and, being harshly treated by her husband, she went to the court of Henry VIII. to sue for a separation. Here she attracted the particular notice of such ladies as were attached to the reformation: on this account she was arrested; and, acknowledging her religious principles, was sent prisoner to Newgate. After having been put to the rack with savage cruelty in the Tower, she was burnt in Smithfield, along with her tutor, and two other persons of the same faith, in 1546. Her letters in Fox and Stryke show her to have been an accomplished and pious woman.

ASKEYTON, a market town of Limerick, seated on the river Deel, 110 miles from Dublin; noted for its castle, built by the earl of Desmond, and for its beautiful abbey.

ASLA'KE. Ang.-Sax. *aslacian*, to abate; to resolve, to unbend, to reduce to its component parts, to slake, or slacken.

But this continual, cruel, civil war
No skill can stint, nor reason can *aslake*. Spenser.

Whilst, seeking to *aslake* thy raging fire,
Thou in me kindlest much more great desire. Id.
But such as of ther golde ther only idoll make,
Noe treasure may the rauyn of their hungry hands
aslake. Surrey.

ASLAN, or ASLANI, in commerce, a name given to the Dutch dollar in most parts of the Levant. The word is also written corruptly, asselani. It is originally Turkish, and signifies a lion, which is the figure stamped on it. The Arabs, taking the figure of a lion for a dog, called it abusketh. It is silver, but much alloyed, and is current for 115 or 120 aspers. See ASPER.

ASLANT'. On slant. See SLANT.
There is a willow grows *aslant* a brook,
That shews his hoar leaves in the glassy stream. Shakespeare. *Hamlet.*

He fell ; the shaft
Drove thro' his neck, *aslant* : he spurns the ground ;
And the soul issues through the weapon's wound. Dryden.

Lo ! now apparent all
Aslant the dew-bright earth and coloured air,
He looks in boundless majesty abroad,
And sheds the shining day that burnished plays
On rocks, and hills, and towers, and wandering
streams,
High gleaming from afar. Thomson.

ASLEE'P. On sleep. See SLEEP.
This false knight vpon delaisie
Hath taried till thei were *asleep*,
As he that woll time kepe
His deadly workes to fulfile. Gower. *Con. Am.* book ii.

How many thousand of my poorest subjects
Are at this hour *asleep* ! O gentle sleep,
Nature's soft nurse, how have I frightened thee !
Shakespeare.

The diligence of trade, and noiseful gain,
And luxury, more late asleep were laid :
All was the night's; and, in her silent reign,
No sound the rest of nature did invade. *Dryden.*

For gorg'd with flesh, and drunk with human wine,
While fast asleep the giant lay supine
Snoring aloud, and belching from his maw
His indigested foam and morsels raw :
We pray, we cast the lots, and then surround
The monstrous body, stretch'd along the ground.

Id. Virgil, Aeneid iii.

There is no difference, between a person asleep,
and in an apoplexy; but that the one can be awaked,
and the other cannot. *Arbuthnot on Diet.*

ASLOPE. On slope, or slip. See SLOPE.

For many times I have it seen,
That many have beglyed been,
For trust that they have set in hope,
Which fell hem afterward asleep.

Chaucer. Romaunt of the Rose, fol. 137. c. 1.

Set them not upright, but aslope, a reasonable
depth under the ground. *Bacon.*

The curse aslope

Glanc'd on the ground; with labour I must earn
My bread! what harm? Idleness had been worse;
My labour will sustain me. *Milton.*

The knight did stoop,

And sate on further side aslope. *Hudibras.*

Where porters' hogsheads roll from carts aslope,
Or brewers down steep cellars stretch the rope;
Where counted billets are by carmen tost,
Stay thy rash step, and walk without the post.

Gay. Trivia, book ii.

ASMODAI, the name given by the Jews
to the prince of dæmons; and according to R.
Elias, the same with Sammael.

ASMONEUS, or **ASSAMONEUS**, the father of
Simon, and chief of the Asmoneans, a family that
reigned over the Jews 126 years.

ASNA, or **ESNA**, a town in Upper Egypt,
seated upon the Nile, believed by some authors
to be the ancient Syena, though others say the
ruins of it are still to be seen near Assuan. It
is so near the cataracts of the Nile, that they
may be heard from thence, and it contains sev-
eral monuments of antiquity; among the rest an
ancient Egyptian temple, painted throughout.
The columns are full of hieroglyphic figures. A
little way from hence are the ruins of an ancient
nunnery, said to be built by St. Helena, and
surrounded with tombs. Asna is the principal
town in these parts, and the inhabitants are rich
in corn and cattle.

ASNAPPER, an Assyrian prince, mentioned
in Ezra iv. 10, who settled the original Samaritans
in the country of the ten tribes. It is un-
certain, whether he was Salmaneser or Esar-
haddon, or one of their generals.

ASOLA, a town of Upper Italy, in the terri-
tory of Brescia, on the Chiese, with a popula-
tion of 4000. It is twenty miles S.S.E. of Brescia.

ASOLO, a Venetian prefecture, in the March of
Treviso, Italy; belonging to Austria. It con-
sists of the town of Asolo, and thirty-six vil-
lages, with 25,000 inhabitants. They cultivate
grapes, corn, fruit, silk, oil, and garden ve-
getables, trade in cattle, and manufacture silk and
woollen stuffs. The town of Asolo is seated on
some agreeable rising grounds, skirted on the
north and west by the Musone.

ASOPH, or **AZOPH**. See AZOPH.

ASOPUS, a town of Laconia, on the Sinus

Laconius, with a port in a peninsula, between
Boe to the east, and the mouth of the Eurotas to
the west. The citadel only remains standing.

ASOPUS, in ancient geography, the name of
several rivers, viz. 1. In Boeotia, which, running
from mount Cithaeron, and watering the territory
of Thebes, separates it from the territory of Pla-
tæa, and falls with an east course into the Euri-
pus, at Tanagra. On this river, Adrastus, king
of Sicyon, built a temple to Nemesis, and from it
Thebes came to be surnamed Asopides. It is now
called Asopo. 2. In Peloponnesus, which runs
by Sicyon, and with a north-west course
falls into the Sinus Corinthiacus, west of Corinth.
3. In Phrygia Major, which with the Lycus
washes Laodicea. 4. On the borders of Thes-
saly, rising in Mount Oeta, and falling into the
Sinus Maliacus.

ASOR, or **ASORUS**, in ancient geography, 1.
A town in the south-west of Judah, near Ascalon,
called also Hazor, and Hasor-Hadata, trans-
lated by the seventy Ασωρη Ταύνη. 2. A town of
Galilee; called the capital of all the kingdoms
north of Palestine. It was taken by Joshua; the
inhabitants were put to the sword, and their
houses burnt. It was afterwards rebuilt, but
remained still in the hands of the Canaanites,
though in the time of Naphthali. It lay north
of the Lacus Samachonites, called in Scripture
the waters of Merom.

ASOTUS, in ichthyology, a species of the silurus.

ASP, { Gr. ασπαρω, to tremble, to quiver.

AS'PEN, { Shaking, trembling; because the
leaves of the aspen tree tremble with each breath
of air.

This Sompnour in his stirops high he stood

Upon this frere his herte was so wood.

That like an aspen leef he quoke for ire.

Chaucer. The Sompnour's Prologue, vi. p. 292.

He to him caught a dagger sharp and keen,

And gave it him in hand: his hand did quake

And tremble like a leafe of aspin greene.

Spenser's Faerie Queene, book i. c. ix. s. 51.

The aspen or asp tree hath leaves much the same
with the poplar, only much smaller, and not so
white. *Mortimer.*

Asp, { Gr. ασπις, a serpent, said to be

Asp'ick, { peculiar to Egypt and Lybia, whose
bite is mortal and its effect immediate. Modern
naturalists have not yet discovered this reptile.

High-minded Cleopatra, that with stroke

Of asp's sting herself did kill. *Faerie Queene.*

Scorpion, and asp, and amphisbena dire,

And dipsas. *Milton.*

ASP, **ASPICK**, thus denominated from the
Greek, ασπις, shield; on account of its lying
convolved in a circle, in the centre of which is
the head, which it exerts, or raises, like the umbo
or umbilicus of a buckler. This species of ser-
pent is very frequently mentioned by authors;
but so carelessly described, that it is not easy to
determine which, if any, of the species known at
present, may probably be called by this name.
It is said to be common in Africa, and about the
banks of the Nile; and Bellonius mentions a
small serpent which he had met with in Italy,
and which had a sort of callous excrescence on
the forehead, which he takes to have been the
aspis of the ancients. It is with the asp that
Cleopatra is said to have despatched herself, and

prevented the designs of Augustus, who intended to have carried her captive to adorn his triumphal entry into Rome. But the fact is contested. Brown places it among the vulgar errors. The indications of that queen's having used the ministry of the asp, were only two almost insensible pricks found in her arm; and Plutarch says it is unknown of what she died. At the same time it must be observed, that the slightness of the pricks found in her arm furnishes no presumption against the fact; for no more than the prick of a needle-point dipped in the poison was necessary for the purpose of destroying life. Lord Bacon says, the asp is the least painful of all the instruments of death. He supposes it to have an affinity to opium, but to be less disagreeable in its operation; and his opinion seems to correspond with the accounts of most writers, as well as with the effects described to have been produced upon Cleopatra. The ancients had a plaster called *di Aspiāwv*, made of this terrible animal, of great efficacy as a discutient of struma and other indurations, and used likewise against pains of the gout. The flesh and skin, or exuviae of the creature, had also their share in the ancient *materia medica*.

ASPA, a town of Parthia, now called Ispahan.

ASPALATHUS, AFRICAN BROOM, a genus of the decandria order, diadelphia class of plants; ranking in the natural method under the thirty-second order, papilionaceæ. The calyx consists of five divisions; the pod is oval, and contains two seeds. Of this genus there are nineteen species; all of which are natives of warm climates, and must be preserved in stoves by those who would cultivate them here. The rose wood, whence the oleum Rhodii, is obtained, is one of the species, but of which we have no particular description.

ASPALATHUS, in pharmacy, is also called lignum Rhodium, or rose wood; and by some Cyprus wood: the former on account of its sweet smell, or growth in the island of Rhodes; the latter from its being also found in the island of Cyprus. It was anciently in much repute, as an astringent and strengthener, but is now little used internally. In virtue, taste, smell, and weight, it resembles the lignum aloes; and in physic they are frequently substituted for each other. Aspalathus is chiefly used in scenting pomatum, and liniments.

ASPARAGIN, the name given to white transparent crystals, of a peculiar vegetable principle, which form in asparagus juice after it has been evaporated to the consistence of syrup. They are in the form of rhomboidal prisms, with a slight nauseous taste. They do not change vegetable blues; nor are they affected by hydro-sulphuret of potash, oxalate of ammonia, or acetate of lead; but lime extracts from them ammonia. Along with the asparagin crystals, others in needles of little consistency appear, analogous to mannite, from which the first can be easily picked out.

ASPARAGUS, SPARAGUS, SPERAGE, or SPARROW-GRASS, a genus of the monogynia order, and the hexandria class of plants; ranking in the natural method under the eleventh order, sarmen-

taceæ: CAL. quinquepartite, and erect; the three inferior petals bent outwards; the berry has three cells, and contains two seeds. There are ten species; but the only one cultivated in the gardens is the common asparagus, with an upright herbaceous stalk, bristly leaves, and equal stipula. The other species are kept only in the gardens of the curious, for the sake of variety. The garden asparagus is cultivated with great care for the use of the table. The propagation of this useful plant is from seed; and, as much of the success depends upon the goodness of the seed, it is much better to save it than to buy. The manner of saving it is this: Mark with a stick some of the fairest buds; and when they are run to berry, and the stalks begin to dry and wither, cut them up; rub off the berries into a tub, and, pouring water upon them, rub them about with your hands; the husks will break and let out the seed, and will swim away with the water in pouring it off; so that in repeating this two or three times, the seeds will be clean washed, and found at the bottom of the tub. These must be spread on a mat to dry, and in the beginning of February, must be sown on a bed of rich earth. They must not be sown too thick, and must be trod into the ground, and the earth raked over them smooth: the bed is to be kept clear of weeds all the summer; and in October, when the stalks are withered and dry, a little rotten dung must be spread half an inch thick over the whole surface of the bed. Next spring, the plants will be fit to plant out; the ground must therefore be prepared for them by trenching it well, and burying a large quantity of rotten dung in the trenches, so that it may lie at least six inches below the surface of the ground: when this is done, level the whole plot exactly, taking out all the loose stones. This is to be done just at the time when the asparagus is to be planted out; which must be in the beginning of March, if the soil is dry, and the season forward; but in a wet soil, it is better to wait till the beginning of April, which is about the season that the plants are beginning to shoot. The season being now come, the roots must be carefully taken up with a narrow-pronged dung-fork, shaking them out of the earth, separating them from each other, and observing to lay all their heads even, for the more conveniently planting them; which must be done in this manner:—Lines must be drawn, at a foot distance each, straight across the bed; these must be dug into small trenches of six inches deep, into which the roots must be laid, placing them against the sides of the trench, with their buds in a right position upwards, and so that, when the earth is raked over them, they may be two inches under the surface of the ground. Between every four rows, a space of two feet and a half should be left for walking in to cut the asparagus. When the asparagus is thus planted, a crop of onions may be sown on the ground, which will not at all hurt it. A month after this, the asparagus will come up, when the crop of onions must be thinned, and the weeds carefully cleared away. About August the onions will be fit to pull up. In October following, cut off the shoots of the asparagus, within two inches of the ground, clear well all

weeds away, and throw up the earth upon the beds, so as to leave them five inches above the level of the alleys. A row of coleworts may be planted in the middle of the alleys, but nothing must now be sown on the beds. In the spring the weeds must be hoed up, and all the summer the beds kept clear of weeds. In October they must be turned up and earthed again, as the preceding season. The second spring after planting, some of the young asparagus may be cut for the table. The larger shoots should only be taken, and these should be cut at two inches under ground, and the beds every year managed as in the second year. But as some people are very fond of early asparagus, the following directions are given, by which it may be obtained any time in winter:—Plant some good roots at one year old in a moist rich soil, about eight inches apart; the second and third year after planting, they will be ready to take up for the hot-beds; these should be made pretty strong, about three feet thick, with new stable dung that has fermented a week or more; the beds must be covered with earth six inches thick; then, against a ridge made at one end, begin to lay in your plants, without trimming or cutting the fibres; and between every row lay a little ridge of fine earth, and proceed thus till the bed is planted; then cover the bed two inches thick with earth, and encompass it with a straw band; and in a week, or as the bed is in the temper, put on the frames and glasses, and lay on three inches thick of fresh earth over the beds, and give them air and add fresh heat to them as it requires. These beds may be made from November till March, which will last till the natural grass comes on.

The roots have a bitterish mucilaginous taste, inclining to sweetness; the fruit has much the same kind of taste; the young shoots are more agreeable than either. Asparagus promotes appetite, but affords little nourishment. It gives a strong ill smell to the urine in a little time after eating it, and for this reason chiefly is supposed to be diuretic; it is likewise esteemed aperient and deobstruent; the root is one of the five called opening roots. Some suppose the shoots to be most efficacious; others, the root; and others, the bark of the root. Stahl is of opinion, that none of them have any great share of the virtues usually ascribed to them. Asparagus appears from experience to contribute very little either to the exciting of urine when suppressed, or increasing its discharge: and in cases where aperient medicines generally do service, this has little or no effect.

ASPASIA, among ancient physicians, a constrictive medicine for the pudenda muliebra. It consisted of wool, moistened with an infusion of unripe galls.

ASPASIA, of Miletus, a courtesan, who settled at Athens under the administration of Pericles, and one of the most noted ladies of antiquity. She was of admirable beauty; yet her wit and eloquence, still more than her beauty, gained her extraordinary reputation among all ranks in the republic. In eloquence she surpassed all her contemporaries; and her conversation was so entertaining, and instructive, that notwithstanding the dishonorable commerce she carried on,

persons of the first distinction, male and female, resorted to her house as to an academy; she even numbered Socrates among her hearers and admirers. She captivated Pericles in such a manner, that he dismissed his own wife, to espouse her; and, by her universal knowledge, irresistible elocution, and intriguing genius, she in a great measure influenced the administration of Athens. She was accused of having excited, from motives of personal resentment, the war of Peloponnesus; yet, calamitous as that long and obstinate conflict proved to Greece, and particularly to Athens, Aspasia occasioned still more incurable evils to both. Her example and instructions, formed a school at Athens, by which her dangerous profession was reduced into a system. The companions of Aspasia served as models for painting and statuary, and themes for poetry and panegyric. Nor were they merely the objects but the authors of many literary works, in which they established rules for the behaviour of their lovers, particularly at table; and explained the art of gaining the heart and captivating the affections. The dress, behaviour, and artifices of this class of women, became continually more seductive and dangerous; and Athens then remained the chief school of vice and pleasure, as well as of literature and philosophy.

ASPASTICUM, or ASPATICUM, i. e. a greeting-house; from *ασπαζομαι*, I salute; in ecclesiastical writers, an apartment adjoining to the ancient churches, wherein the bishops and presbyters sat to receive the salutations of those who came to visit them, desire their blessing, or consult them.

ASPECT, v. & n. Lat. *aspicio, aspectum*, (from the obsolete word *aspicere*), to look towards. **ASPECTED**, The appearance anything presents when looked at; the point of view; the relation or influence which one thing has or bears with respect to another.

We see likewise the Scripture calleth Envy, an evil eye, and the astrologers call the evil influences of the stars, evil aspects; so that there still seemeth to be acknowledged in the act of envy, an ejaculation or irradiation of the eye. *Lord Bacon's Essays*. The islands prince, of frame more than celestial, Is rightly called the all-seeing Intellect, All glorious bright such nothing is terrestrial; Whose sun-like face, and most divine aspect, No human sight may ever hope deserve; For when himself on's self reflects his eye, Dull and amazed he stands, at such bright majesty.

Fletcher's Purple Island.

If nature's concord broke
Among the constellations war were sprung,
Two planets, rushing from aspect malign
Of fiercest opposition, in mid sky
Should combat, and their jarring spheres confound.

Milton's Paradise Lost, book vi.

Happy in their mistake, those people, whom
The northern pole aspects; whom fear of death
(The greatest of all human fears) ne'er moves.

Temple.

To this use, of informing us what is in this aspectable world, we shall find the eye well fitted.

Ray on the Creation.

Her motions were steady and composed, and her aspect serious but cheerful; her name was Patience.

Addison.

Why does not every single star shed a separate influence, and have *aspects* with other stars of their own constellation? *Bentley's Sermons.*

With aspect mild, and elevated eye,
Behold him seated on a mount serene,
Above the fog of sense and passion's storm:
Wrong he sustains with temper, looks on heaven,
Nor stoops to think his injuries his foe;
Nought but what wounds his virtue wounds his peace.

Young.

ASPECT, in astronomy and astrology, denotes the situation of the planets and stars with respect to each other. There are five different aspects. 1. Sextile aspect is when the planets or stars are 60° distant, and marked thus * . 2. The quartile, or quadrate, when they are 90° distant, marked \square . 3. Trine, when 120° distant, marked Δ . 4. Opposition, when 180° distant, marked \circ . And, 5. Conjunction, both in the same degree, marked δ . Kepler, who added eight new ones, defines aspect to be the angle formed by the rays of the two stars meeting on the earth, whereby their good or bad influence is measured; for it is to be observed that these aspects, being first introduced by astrologers, were distinguished into benign, malignant, and indifferent; the quartile and malignant being accounted malign; the trine and sextile, benign or friendly; and the conjunction inimicent.

ASPECT, in gardening, signifies exposure.

ASPECT, DOUBLE, is used in painting, where a single figure is so contrived, as to represent two or more different objects, either by changing the eye, or by means of angular glasses. See OPTICS.

ASPECT, in architecture. The aspect of the principal rooms of a house, demands the greatest attention from the architect, especially in an exposed situation. The south-east is the best for Britain; and the south and due east the next. The south-west is the worst, because from that quarter it rains oftener than from any other. A north aspect is gloomy, because deprived of sun-shine; but woods look best when viewed from rooms with a north aspect, because all plants and trees are most luxuriant on the side next the sun. An aspect due east is nearly as bad as the north, because there the sun shines only early in the morning; and the aspect due west is intolerable, from the sun dazzling the eye through the greatest part of the day. Hence we may conclude, a square house placed with its front, opposite to the four cardinal points, will have one good and three bad aspects.

ASPEN. or *Asp.* See POPLAR, of which it is a species. The leaves of this tree always tremble. The aspen or asp tree has leaves much the same with the poplar.

ASPER, in commerce, or aspre, a little Turkish silver coin, wherein most of the Grand Seignior's revenues are paid. The asper is worth something more than an English halfpenny. The only impression it bears, is that of the prince's name under whom it was struck. The pay of the Janissaries is from two to twelve aspers per diem.

ASPER, in grammar, an accent peculiar to the Greek language, marked thus ('); and importing, that the letter over which it is placed ought to be strongly aspirated, or pronounced as if an h were prefixed.

ASPER, in ichthyology, a small fish caught in the Rhone, so called from the roughness of its scales. Its head is large, in proportion to its body, and of a pointed shape. It has no teeth, but its jaws are sharp to the touch. It is of a dark red color, with large black spots. It is good to eat, and is esteemed aperitive.

ASPERA ARTERIA, in anatomy, the windpipe or trachea. See ANATOMY.

ASPERJELLOUS, in botany, the name given by Michaeli to that genus of mosses, called by Dillenius and others, *bryum*.

ASPERGILE, or *ASPERGILUM*, in antiquity, a long brush made of horse-hair, fixed to a handle, wherewith the lustral water was sprinkled on the people in lustrations and purifications. The ancients, instead of a brush, made use of branches of laurel and olive. It is also still applied to the instrument in Romish churches with which holy water is sprinkled.

ASPERIFOLIE PLANTÆ, rough-leaved plants. The name of a class in Hermaunus, Boerhaave, and Ray's methods, consisting of plants which have naked seeds, and whose leaves are rough to the touch. In Tournefort's system, these plants constitute the third section or order of the second class; and in Linnaeus's sexual method, they make a part of the pentandria monogynia.

ASPERIFOLIATE, or *ASPERIFOLIOUS*, among botanists, such plants as are rough-leaved, having their leaves placed alternately on their stalks, and a monopetalous flower divided into five parts. They constitute the forty-ninth order of plants in the *Fragmenta Methodi Naturalis* of Linnaeus, in which are these genera: tournefortia, cerinthe, symphytum, pulmonaria, anchusa, lithospermum, myosotis, heliotropium, cynglossum, asperugo, lycopsis, echium, barago: magis minusve, olaceæ, mucilaginosæ, et glutinosæ sunt.

ASPERITY, the inequality of the surface of any body, which hinders the hand from passing over it freely. From the testimony of some blind persons, it has been supposed that every color hath its particular degree of asperity; though this has been denied by others. See the article BLIND.

ASPERN, a market town, castle, and lordship of Lower Austria, in the circle of lower Mannhartsberg, belonging to the count of Brenner, ten miles south east of Laba.

ASPERN, a market town of Austria, situated on a small arm of the Danube, on the north side of the river, at some distance below Vienna, the scene of a battle fought on the twenty-first and twenty-second of May, 1809, between Buonaparte and the Austrians. It was completely destroyed at the time, but has since been rebuilt.

ASPERSE, Lat. *ad*, and *spargo*, to scatter.

ASPERSION. ter. To sprinkle or scatter; metaphorically to censure, to calumniate.

In the business of Ireland, besides the opportunity to asperse the king, they were safe enough.

Clarendon.

Curb that impetuous tongue; nor rashly vain,
And singly mad, asperse the sov'reign reign. *Pope.*

Unjustly poets we asperse;
Truth shines the brighter clad in verse. *Swift.*

He set his voice

At highest pitch, and thus aspers'd the king.

Couper's *Iliad*, book vi.

Legions of impure spirits were believed to take often possession of the bodies of men, from whence nothing could drive them but aspersions of holy water.

Bolingbroke's Essay on Human Knowledge.

ASPERUGO, small wild bugloss, in botany, a genus of the pentandria monogynia class; ranking in the natural method under the asperifoliae. The calyx of the fruit is compressed, with folds flatly parallel, and sinuous. There are two species, viz. 1. A. *Egyptiaca*, a native of Egypt. 2. A. *procumbens*, or wild bugloss, a native of Britain; which is eaten by horses, goats, sheep, and swine; but cows are not fond of it.

ASPERULA, Woodroof, in botany, a genus of the monogynia order, and the hexandria class of plants; ranking in the natural method under the forty-seventh order, stellatae. The corolla is infundibuliform; and the capsule contains two globular seeds. There are two species; which both grow wild in Britain, and therefore are seldom admitted into gardens, viz. 1. A. *cyanochica*, found on chalky hills. The roots are used for dyeing red in Sweden. 2. A. *odorata*, a low umbelliferous plant, growing wild in woods and copses, and flowering in May. It has an exceeding pleasant smell, which is improved by moderate exsiccation; the taste is subsaline, and somewhat austere. It imparts its flavour to vinous liquors. Asperula is supposed medicinally to attenuate viscid humors, and strengthen the tone of the bowels; modern practice has nevertheless rejected it.

ASPEYTLA, a town of Spain, in Biscay, seated on the Urola, in a fine valley, near the districts of Loyola and Onis.

ASPHALITES, in anatomy, the fifth vertebra of the loins.

ASPHALTITES, a lake of Judea, so called from the great quantity of bitumen it produces; called also the Dead Sea; and from its situation the East, the Salt Sea, the Sea of Sodom, the Sea of the Desart, and the Sea of the Plain, in the sacred writings. It is enclosed on the east and west with high mountains; on the north it has the plain of Jericho; or, if we take in both sides of the Jordan, it has the Great Plain, properly so called, on the south, which is open, and extends beyond the reach of the eye. Josephus makes this lake 580 furlongs in length, from the mouth of the Jordan to the opposite end, that is about twenty-two leagues; and about 150 furlongs, or five leagues, in its greatest breadth; but our modern accounts commonly give it twenty leagues in length, and six or seven in breadth. On the west side of it is a kind of promontory, where the remains of Lot's metamorphosed wife were for a long time said to be visible. Josephus says this pillar was standing in his time; and Mr. Maundrell was shown a block or stump of it.

In what has been said and written of the Lake Asphaltites, fable is much blended with truth. We are told that it arose from the submersion of the vale of Siddim, where once stood, as is commonly reported, the three cities which perished in the miraculous conflagration, with Sodom and Gomorrah; and this lake has been regarded as a lasting monument of the just judgment of God,

on the abominations for which they perished. It has been stated that its waters are so impregnated with salt, sulphur, and other bituminous matter, that nothing will sink or live in them; and that it emits such a horrid smoke that the very birds die in attempting to cross over it. The description likewise of the apples that grew about it, fair without, and only ashes and bitterness within, were looked upon as a further demonstration of God's anger. Travellers have also described the country round about as sulphureous, bituminous, and suffocating; and it has even been affirmed that the ruins of the five cities are still to be seen through the waters in clear weather.

It appears to be true, that the quantity of salt, alum, and sulphur, with which they are impregnated, render its waters so much specifically heavier (Dr. Pococke says one fifth) than fresh water, that bodies will not easily sink in them: yet that author and others assure us they have swam and dived in it. Dr. Pococke also, though he neither saw fish nor shells, tells us, on the authority of a monk, that fish had been caught in it; and M. Volney affirms that it is very common to see swallows skimming its surface, and dipping for the water necessary to build their nests. ~~The~~ around it, he adds, impregnated with salt, produces no plants; and the air itself, which becomes loaded with it from evaporation, and which receives also the sulphureous and bituminous vapours, cannot be favorable to vegetation: hence the deadly aspect which reigns around this lake. In other respects the ground about it, however, is not marshy, and its waters are limpid and incorruptible, as must be the case with a dissolution of salt. On the south-west shore are mines of fossil sait, of which I have brought away several specimens. They are situated on the side of the mountains which extend along that border; and from time immemorial have supplied the neighbouring Arabs, and even the city of Jerusalem. We find also on this shore fragments of sulphur and bitumen, which the Arabs convert into a trifling article of commerce: as also hot fountains and deep crevices, which are discovered at a distance by little pyramids built on the brink of them. Likewise a sort of stone, which on rubbing emits a noxious smell, burns like bitumen, receives a polish like white alabaster, and is used for the paving of court-yards. At intervals we also meet with unshapen blocks, which prejudiced eyes mistake for mutilated statues, and which pass with ignorant and superstitious pilgrims for monuments of the adventure of Lot's wife; though it is nowhere said she was metamorphosed into stone like Niobe, but into salt, which must have melted the ensuing winter.'

This lake is at present called by the Arabs Almotanah and Bahret Lout, and Ula Deguis by the Turks. It is remarkable that but one European has hitherto succeeded in making the circuit of it; and Nau, who in his travels had recorded this expedition of Daniel, abbot of St. Saba, states on his authority, that 'the Dead Sea, at its extremity, is separated as it were into two parts, and that there is a way by which you may walk across it, being only mid-leg deep, at

least in summer; that there the land rises, and bounds another small lake of a circular or rather oval figure, surrounded with plains and mountains of sand, and that the neighbouring country is peopled by innumerable Arabs. Seetzen in the year 1805-6 passed round the southern extremity, but a short account only of his route, in a correspondence with M. de Zach, printed by the Palestine Association in 1810, has yet appeared. Mr. Bureckhardt was unable to reach its borders. He was informed in the neighbourhood that there were spots in a ford about three hours north of Szaffye (the extreme southern point of the lake), in which the water is quite hot, and the bottom of red earth. This ford may be crossed in three hours and a half: the water here is generally not more than two feet deep, and it is probable there are hot springs in the bottom. It is so strongly impregnated with salt that the skin peels off the legs of those who wade across it.

M. de Chateaubriand, who visited this country in 1807, has given the first decided testimony that the Lake Asphaltites abounds with fish. He reached it when it was dark, and passed the night among some Arab tents. 'About midnight,' says he, 'I heard a noise upon the lake, and was told by the Bethlehemite [redacted] accompanied me, that it proceeded from legions of small fish, which come out and leap about the shore.' He speaks in the following terms of its saline properties; 'The first thing I did on alighting was to walk into the lake up to my knees, and to taste the water. I found it impossible to keep it in my mouth. It far exceeds that of the sea in saltiness, and produces upon the lips the effect of a strong solution of alum. Before my boots were completely dry they were covered with salt: our clothes, our hats, our hands, were in less than three hours impregnated with this mineral.'

A modern Scottish traveller, Mr. Gordon of Clunie, who bathed in it, brought home a phial of its water, and Dr. Marcet found its specific gravity to be 1.211; a degree of density, says he, 'not to be met with in any other natural water.' The whole process with its results is detailed in the Philosophical Transactions for 1807. It was found that 100 grains of the water contain the following substances in the undermentioned proportions:

	grains.
Muriat of lime . . .	3,920
Muriat of magnesia	10,246
Muriat of soda . . .	10,360
Sulphat of lime . .	0,054
<hr/>	
	24,580

Another celebrated chemist, M. Klaproth, who procured a specimen brought from the East by the abbé Martin, found the specific gravity to be 1.245 instead of 1.211; agreeing in this respect more nearly with Macquer and Lavoisier, who stated it at 1.240. But the specific gravity of Dr. Marcet's specimen may have been less from its having been taken from the lake not far from the influx of the Jordan, where it might be somewhat diluted.

Dr. Clarke says that the inhabitants of the country still regard the Dead Sea with feelings of terror; owing probably to the tradition that its waters cover the engulfed cities of Sodom and Gomorrah, or to the ideas entertained of the peculiar insalubrity of its exhalations. But it is greatly to be regretted that this traveller was prevented by the Arabs from exploring the lake, which he only saw at a distance.

Hasselquist asserts the apples of Sodom to be the production of the solanum melongena of Linnaeus. This is found, he says, in great abundance round Jericho and in the neighbourhood of the Dead Sea. The dust with which it is sometimes filled is the work of an insect (*tenthredo*) which pulverises the whole of the inside, leaving the rind entire and unchanged in color. M. Seetzen saw at Kerek a species of cotton which he was told was produced from a fruit resembling a pomegranate, growing on the borders of the Dead Sea, and he thinks it is this pulless fruit which is the malum sodomaeum. Viscount Chateaubriand saw a third fruit, which he conjectures to be the famous apples in question, growing on a thorny shrub; and which, before it is ripe is filled with a corrosive and saline juice; when dried it yields a blackish seed, which may be compared to ashes, and which in taste resembles bitter pepper.

ASPHALTUM, BITUMEN JUDAICUM, or Jew's Pitch, is a light solid bitumen of a dusky color on the outside, and a deep shining black within; of very little taste, and having scarcely any smell, unless heated, when it emits a strong pitchy one. It is found in a soft or liquid state on the surface of the Dead Sea, and by age grows dry and hard. The same kind of bitumen is met with likewise in the earth in China, America, and in some places of Europe, as the Carpathian Hills, France, &c. The most abundant deposits of this substance, in modern times, are said to be in the islands of Barbadoes and Trinidad; in the former it is found as an highly bituminous earth, but, being in a state of great impurity, is only used as a coal for fuel. In the latter island is a complete lake of this substance. A specimen from Albania of the specific gravity of 1.205, examined by M. Klaproth, was found to be soluble only in oils and in aether. Five parts of rectified oil of petroleum dissolved one of the asphaltum without heat in twenty-four hours; 100 grains of asphaltum afforded 32 of bituminous oil, 6 of water faintly ammoniacal, 30 of charcoal, $\frac{7}{3}$ of silex, $\frac{7}{3}$ of alumina, $\frac{1}{3}$ of lime, $\frac{1}{3}$ oxide of iron, $\frac{1}{3}$ oxide of manganese, and 36 cubic inches of hydrogen gas. The true asphaltum was formerly used in embalming the bodies of the dead. At present the thick and solid asphalta are employed in Egypt, Arabia, and Persia, as pitch for ships; the fluid ones for burning in lamps and for varnishes. Some writers relate that the walls of Babylon and the temple of Jerusalem were cemented with bitumen instead of mortar. This much is certain, that a true natural bitumen, that for instance which is found in the district of Neufchâtel, proves an excellent cement for walls, pavements, and other purposes; uncommonly firm, very durable in the air, and not penetrable by water. The watch and clock-makers use a com-

position of asphaltum, fine lamp black, and oil of spike or turpentine, for drawing the black figures on dial-plates; this composition is prepared chiefly at Augsburg and Nuremberg.

ASPHODEL, **ASPHODELUS**, or **KING'S SPEAR**, in botany, a genus of the monogynia order, and hexandria class of plants. The calyx is divided into six parts; and the nectarium consists of six valves covering the nectarium. There are five species, viz. 1. *A. albus*, the white asphodel, with keel-shaped leaves, has roots composed of small fibres and knobs at bottom; the leaves are long, almost triangular, and hollow like the keel of a boat; the stalks seldom rise above two feet high, and divide into several spreading branches; these are terminated by loose spikes of white flowers. 2. *A. luteus*, or common yellow asphodel, has roots composed of many thick fleshy fibres, which are yellow, and joined to a head at the top; from whence arise strong round single stalks nearly three feet high, garnished on the upper part with yellow star-shaped flowers, which appear in June, and the seeds ripen in autumn. 3. *A. nonramosus*, or the unbranched asphodel, roots like the ramosus (which see), but the leaves are longer and narrower; the stalks are single; the flowers appear at the same time with the former, are of a purer white, and grow in longer spikes. 4. *A. ramosus*, or branching asphodel, has roots composed of fleshy fibres, to each of which is fastened an oblong bulb as large as a small potatoe; the leaves are long and flexible, having sharp edges; between these come out the flower-stalks, which arise more than three feet high, sending forth many lateral branches. They come out in the beginning of June, and the seeds ripen in autumn. 5. *A. stellatus*, or annual branching spiderwort, hath roots composed of many yellow fleshy fibres; the leaves are spread out from the crown of the root, close to the ground, in a large cluster; these are convex on their underside, but plain above. The flower-stalks rise immediately from the root, and grow about two feet high, dividing into three or four branches upward, which are adorned with white starry flowers, with purple lines on the outside. These flower in July and August, and their seeds ripen in October.

The way to increase these plants is by parting their roots in August, before they shoot up their fresh green leaves. They may also be raised from seeds sown in August; and the August following the plants produced from these may be transplanted into beds, and will produce flowers the second year. They must not be planted in small borders among tender flowers, for they will draw away all the nourishment and starve every thing else. The Lancashire asphodel is thought to be very noxious to sheep, whenever through poverty of pasture they are necessitated to eat it; although they are said to improve much in their flesh at first, they afterwards die with symptoms of a diseased liver. This is the plant of which such wonderful tales have been told by Pauli Bartholine, and others, of its softening the bones of such animals as swallow it; and which they thence called gramen ossifragum. Horned cattle eat it without any ill effect.

ASPHIURELATA, in natural history, are semi-metallic fossils, fusible by fire, and not malleable in their purest state, being in their native state intimately mixed with sulphur and other adventitious matter, and reduced to what are called ores. Of this series of fossils there are five bodies, each of which makes a distinct genus; viz., antimony, bismuth, cobalt, zinc, and quicksilver.

ASPHYXIA; from α privative, and $\sigma\phi\psi\xi\alpha$, a pulse; in medicine, the state during life in which the pulsation of the heart and arteries cannot be perceived. Medical writers usually divide this suspended animation into lipothymia, apoplexia, syncope, submersio, suspensio, and congelatio. Mr. Sage has published a treatise recommending the volatile alkali fluor as the most effectual remedy in asphyxies. Asphyxia is also used by some for a privation of pulse in a part of the body, e. g. in the arm, &c.

The following extraordinary case of asphyxia is related by Dr. Cheyne, in his English Malady, p. 307. ‘Case of the Hon. Colonel Townshend.—Col. Townshend, a gentleman of excellent natural parts, and of great honor and integrity, had for many years been afflicted with a nephritic complaint, attended with constant vomitings, which had made him ~~highly~~ painful and miserable. During the whole time of his illness he had observed the strictest regimen, living on the softest vegetables, and lightest animal foods, drinking asses milk daily, even in the camp; and for common drink, Bristol water, which the summer before his death he had drank on the spot. But his illness increasing, and his strength decaying, he came from Bristol to Bath in a litter, in autumn, and lay at the Bell-inn. Dr. Baynard (who is since dead) and I were called to him, and attended him twice a day for about the space of a week, but his vomitings continuing still incessant and obstinate against all remedies, we despaired of his recovery. While he was in this condition he sent for us early one morning: we waited on him with Mr. Skrine, his apothecary, (since dead also); we found his senses clear and his mind calm, his nurse and several servants were about him. He had made his will and settled his affairs. He told us he had sent for us to give him some account of an odd sensation he had for some time observed and felt in himself; which was that, composing himself, he could die or expire when he pleased, and yet, by an effort or some how, he could come to life again; which it seems he had sometimes tried before he had sent for us.

‘We heard this with surprise; but as it was not to be accounted for from any common principles, we could hardly believe the fact as he related it, much less give any account of it, unless he should please to make the experiment before us, which we were unwilling he should do, lest in his weak condition he might carry it too far. He continued to talk very distinctly and sensibly above a quarter of an hour about this (to him) surprising sensation, and insisted so much on our seeing the trial made, that we were at last forced to comply. We all three felt his pulse first; it was distinct, though small and thready; and his heart had its usual beating. He composed him-

self on his back, and lay in a still position some time; while I held his right hand, Dr. Baynard laid his hand on his heart, and Mr. Skrine held a clear looking-glass to his mouth. I found his pulse sink gradually, till at last I could not feel any by the most exact and nice touch. Dr. Baynard could not feel the least motion in his heart, nor Mr. Skrine the least soil of breath on the bright mirror he held to his mouth; then each of us by turns examined his arm, heart, and breast; but could not, by the nicest scrutiny, discover the least symptom of life in him. We reasoned a long time about this odd appearance as well as we could, and all of us judging it inexplicable and unaccountable, and finding he still continued in that condition, we began to conclude that he had indeed carried the experiment too far, and at last were satisfied he was actually dead, and were just ready to leave him. This continued about half an hour, by nine o'clock in the morning, in autumn. As we were going away we observed some motion about the body, and, upon examination, found his pulse and the motion of his heart gradually returning; he began to breathe gently, and speak softly; we were all astonished to the last degree at this unexpected change, and after some further conversation with him, and among ourselves, not away fully satisfied as to all the particulars of this fact, but confounded and puzzled, and not able to form any rational scheme that might account for it. He afterwards called for his attorney, added a codicil to his will, settled legacies on his servants, received the sacrament, and calmly and composedly expired about six o'clock that evening. Next day he was opened (as he had ordered); his body was the soundest and best made I had ever seen; his lungs were fair, large, and sound, his heart big and strong, and his intestines sweet and clean; his stomach was of a due proportion, the coats sound and thick, and the villous membrane quite entire; but when we came to examine the kidneys, though the left was perfectly sound and of a just size, the right was about four times as big, distended like a blown bladder, and yielding as if full of pap; he having often passed a wheyish liquor, after his urine, during his illness. Upon opening this kidney we found it quite full of a white chalky matter, like plaster of Paris, and all the fleshy substance dissolved and worn away by what I called a nephritic cancer. This had been the source of all his misery; and the symptomatic vomitings, from the irritation on the sentient nerves, had quite starved and worn him down. I have narrated the facts as I saw and observed them, deliberately and distinctly, and shall leave the philosophic reader to make what inferences he thinks fit. The truth of the material circumstances I will warrant.

ASPIC, in botany, a plant which grows in plenty in Languedoc, in Provence, and especially on the mountain of St. Baume in France. It is a kind of lavender, nearly like what grows in our gardens, both with regard to the figure and color of its leaves and flowers. The botanists call it *lavandula mas*, or *spica nardi*, *pseudo nardus*, &c.

ASPILATES, or **ASPLENITES**, in the writings

of the ancients, the name of a stone, famous for its virtues against the spleen, and many other disorders; it was to be applied externally, and fastened to the part with camel's hair.

ASPINY, or **ANGLARY-THORN**, a drug used in medicine, on which particular duties are imposed by the tariff of the custom-house at Lyons.

ASPIRE',

ASPIRANT,

ASPIR'ATE, *v. n. & adj.*

ASPIRA'TION,

ASPIRE'MENT,

ASPIR'ER,

ASPIR'ING.

Aspiro; from *ad*,

and *spiro*, to breathe;

to search after dilig-

ently, and in con-

sequence of the ar-

duous exertion to

breathe frequently,

and with apparent difficulty; to pant after; to pursue with eagerness an object deemed worthy of our ambition; to desire with eagerness. To aspire is to breathe strongly upon a letter in sounding it.

"Tis he; I ken the manner of his gait:
He rises on his toe; that spirit of his
In aspiration lifts him from the earth.

Shakespeare.

Horace did ne'er aspire to epic bays;
Nor lofty Maro stoop to lyrick lays.

Roscommon.

Till then a helpless, hopeless, homely swain;
I sought not freedom, nor aspired to gain.

Dryden.

Aspiring to be gods, if angels fell,

Aspiring to be angels, men rebel.

Pope.

H is only a guttural aspiration; i. e. a more forcible impulse of the breath from the lungs.

Holder.

A soul inspired with the warmest aspirations after celestial beatitude, keeps its powers attentive.

Watts.

Know thine own worth, and reverence the lyre.
Wilt thou debase the heart which God refined?

No! let thy heaven-taught soul to heaven aspire,
To fancy, freedom, harmony, resign'd;

Ambition's groveling crew for ever left behind.

Beattie's Minstrel.

Some more aspiring catch the neighbouring shrub,
With clasping tendrils, and invest her branch.

Couper.

Ye stars! which are the poetry of heaven!
If in your bright leaves we would read the fate
Of men and empires,—tis to be forgiv'n,
That in our aspirations to be great,
Our destinies o'erleap their mortal state,
And claim a kindred with you;

Lord Byron's Childe Harold.

ASPIUS, in ichthyology, a species of the cyprinus, belonging to the abdominal order. It is met with in the lakes of Sweden.

ASPORTA'TION. Lat. *ad*, and *porto*, to carry; a carrying to.

A bare removal from the place in which he found the goods, though the thief does not quite make off with them, is a sufficient asportation or carrying away.

Blackstone.

ASPORTAGOEN MOUNT, a sea-mark on the coast of Nova Scotia, from which ships bound from Europe to Halifax generally look out. It rises on the promontory, between Mahone and Margaret's bay, to about 500 feet above the level of the sea.

AS'PRE,

AS'PRELY,

AS'PRENESS,

AS'PERATE,

ASPE'RITY,

AS'PEROUS.

Lat. *asper*, rough in its nature: applied to that which is harsh, rugged, grating, bitter, morose.

Black and white are the most *asperous* and unequal of colours; so like, that it is hard to distinguish them: black is the most rough. *Boyle.*

I hope it is no very cynical *asperity*, not to confess obligations where no benefit has been received, or to be unwilling that the public should consider me as owing to a patron, that which Providence has enabled me to do for myself. *D. S. Johnson.*

The patience of Job is proverbial. After some of the convulsive struggles of our irritable nature, he submitted himself, and repented in dust and ashes. But even so, I do not find him blamed for reprehending, and with a considerable degree of *asperity*, those ill-natured neighbours of his who visited his dunghill to read moral, political, and economical lectures on his misery. *Burke.*

ASP'Y, v. & n. See **ESPY.**

In due season, as she alway *aspied*

Every thing to execute conueniently,

The one louer first frendly she eied,

The seocnd she offred the cuppe curtesly.

Chaucer. The Rein of Loue.

For Ion seide to Eroude, it is not leueful to thee to have the wyf of thi brother, and Erodias leide *aspies* to him and woldes sle him and myghte not.

Wielif. Mark, ch. vi.

ASRAEL, the angel, according to the Mahomedan system, who is appropriated to take care of the souls of those who die.

ASS, } **AS'ININE,** } Lat. *asinus*, a well known animal.
ASS'LIKE. }

You have among you many a purchas'd slave; Which, like your *asses* and your dogs and mules, You use in abject and in slavish part, Because you bought them. *Shakespeare.*

You shall have more ado, to drive our dullest youth, our stocks and stubs, from such nurture; than we have now, to hale our choicest and hopefulllest wits, to that *asinine* feast of sow-thistles and brambles. *Milton.*

Ass, in zoology. See **EQUUS.**

Ass, **CORONATION OF THE**, in antiquity, was a part of the ceremony of the feast of Vesta, wherein the bakers put crowns on the heads of these quadrupeds; *Ecce coronatis panis dependet asellis!* Hence, in an ancient calendar, the ides of June are thus denoted: *Festum est Vestae. Asinus coronatur!* This honor it seems was done the beast, because, according to the mythology, by its braying it had saved Vesta from being ravished by the Lampsacan god. Hence the formula, *Vestae delicium est asinus.*

ASSAC, or **ASSAX**, in the *materia medica* of the ancients, the name given by the Arabians to the gum ammoniac of the Greeks; but by many of the qualities attributed to this drug it does not appear to be the same that is now called so.

ASSACH, or **ASSATI**, a kind of purgation, anciently used in Wales, by the oaths of 300 men.

ASSAI, in music, signifies quick; or, according to others, that the motion of the piece be kept in a middle degree of quickness or slowness: as, *assai allegro*, *assai presto*. See **ALLEGORO** and **P'RESTO**.

ASSAIL', Fr. *assailir*, Lat. **ASSAIL'ABLE**, } *adsalire*, to leap upon.
ASSAIL'ANT, v. & adj. } To assault; to make a
ASSAIL'ER, } sudden and vehement
ASSAIL'MENT, } attack by various means
of annoyance.

So, when he saw his flatt'ring arts to fail,
With greedy force he 'gan the fort t' *assail*.

Faerie Queene

I'll put myself in poor and mean attire,
And with a kind of umber smirch my face;
The like do you: so shall we pass along,
And never stir assailants. *Shakespeare.*

My gracious lord, here in the parliament
Let us *assail* the family of York. *Id.*

She will not stay the siege of loving terms,
Nor bide th' encounter of *assailing* eyes. *Id.*

How have I feard' your fate! but fear'd it most,
When love *assail'd* you on the Libyan coast. *Dryden.*

Prompt to *assail* and careless of defence,
Invulnerable in his impudence;
He dares the world; and eager of a name,
He thrusts about, and jostles into fame. *Id. Hind and Panther.*

All books he reads, and all he reads *assails*,
From Dryden's Fables down to D—y's Tales. *Pope.*

Sensible of their own force, and allured by the prospect of so rich a prize, the northern barbarians, in the reign of Arcadius and Honorius, *assailed* at once all the frontiers of the Roman empire. *Hume.*

When winds the mountain oak *assail*,
And lay its glories waste,
Content may slumber in the vale,
Unconscious of the blast. *Beattie.*

ASSAM, or **ASHAM**, a country between Bengal and Thibet, 700 miles in length, by about 70 in breadth. It is intersected by the Brahmapootra and several rivers. On the north it is bounded by the mountains of Bootan and Thibet, on the south by the Garrow mountains, on the west by Bengal and Bisnee, and on the east by the tributaries of Ava and China. Assam is very fertile, and produces a considerable quantity of gold, found in the beds of the rivers; it also yields ivory, lac, pepper, silk, and cotton, and exports a considerable quantity of borax and musk, said to be procured from Bootan and Thibet. Its imports from Bengal are principally salt, various European commodities, and a few fine muslins. The inhabitants are genuine Hindoos, and are very shy of permitting foreigners to come among them. During the period that the Afghans and Moguls had possession of Bengal they frequently invaded this country, and even took possession of Ghergong the capital, but the unhealthiness of the climate compelled them always to retire with great loss. In the year 1793 a detachment of the East India Company's troops, under the command of Colonel Welsh, entered Assam for the purpose of reinstating the rajah Surjee Deo; and, in consequence of the services then rendered him, the rajah established a reciprocal liberty of commerce between himself and the British; and it was finally agreed that no European merchant or adventurer, of any description, should be allowed to fix his residence in Assam, without having previously obtained the permission of the British government, and of Maha Rajah Surjee Deo, of Assam.

ASSANCALA, or **ASSANCALE**, a strong town in Armenia, near the river Arras, in the road between Erzerum and Erivan, noted for its hot baths. It stands on a high hill, twenty-two miles east of Erzerum; the walls are built in a spiral line all round the rock, and strengthened

ASS

with square towers. The ditches are about two fathoms over, cut out of hard rock.

ASSAPOORY, in natural history, a name given by the people of the East Indies to a peculiar species of slate, which they use in medicine, reducing it to powder, and strewing it on burning coals that the sick person may receive the fumes of it. It is principally used for children when they are disordered by taking cold. The smell of it, while burning, is very offensive.

ASSARIUM, a small copper coin, being a part of the as. The word is used by Suidas indifferently with οβολος, and ρυμα, to denote a small piece of money; in which he is followed by Cujacius, who defines ασσαριον, by minimus aeris nummus. We find mention of the assarion in Matthew, chap. x. ver. 29., translated a farthing.

ASSARON, an ancient Jewish measure of capacity, equal to the tenth part of an ephah. The assaron is the same with the omer. Josephus calls it εσσαρον; in the Hebrew it is written assarath. It was the measure of manna appointed for each person.

ASSAS'SIN, v. & n. { The etymology of ASSAS'SINACY, } this word has given ASSAS'SINATE, v. & n. } rise to much learned ASSASSIN'ATION. } discussion, and the question is still undecided. Applied to one who attacks and kills those unprepared for defence, by treachery, or sudden violence.

It were done quickly; if th' *assassination*
Could trammel up the consequence. *Shakspeare.*
Such usage as your honourable lords
Afford me, *assassinat*ed and betray'd;
Who durst not, with your whole united pow'r,
In fight withstand one single and unarm'd.

Milton.

The Syrian king; who, to surprise
One man, *assassin* like, had levy'd war,
War unproclaim'd. *Id.*
The duke finished his course by a wicked *assassination*. *Clarendon.*

In the very moment, as the knight withdrew from the duke, this *assassinat* gave him, with a back blow, a deep wound into his left side. *Wotton.*

The old king is just murdered; and the person that did it is unknown—Let the soldiers seize him, for one of the *assassines*; and let me alone, to accuse him afterwards. *Dryden.*

Here hired *assassins* for their gain invade;
And treach'rous pois'n'ers urge their fatal trade. *Creech.*

When she hears of a murder, she enlarges more on the guilt of the suffering person, than of the *assassin*. *Addison.*

Orestes brandish'd the revenging sword;
Slew the dire pair; and gave to fun'ral flame. *Pope.*

The vile *assassin*, and adul'trous dame, *Pope.*
Useful, we grant; it serves what life requires;
But, dreadful too, the dark *assassin* hires. *Id.*

ASSASSINS, a tribe or clan in Syria, called also Ismaelians and Batanists, or Batenians. These people probably owed their origin to the Karmatians, a famous heretical sect among the Mahomedans, who settled in Persia about the year 1090; whence, in process of time, they sent a colony into Syria, where they became possessed of a considerable tract of land among the mountains of Lebanon, extending itself from the neighbourhood of Antioch to Damas-

ASS

cus. The first chief and legislator of this extraordinary tribe was Hassan Sabah, a subtle impostor; who, by his artifices, made fanatical and implicit slaves of his subjects. Their religion was compounded of that of the Magi, the Jews, the Christians, and the Mahomedans: but the capital article of their creed was to believe that the Holy Spirit resided in their chief; that his orders proceeded from God himself, and were real declarations of the divine pleasure. To this monarch the orientals gave the name of Scheik: but he is better known in Europe by the name of the Old Man of the Mountain. This chief, from his residence on mount Lebanon, sent, like a vindictive deity, inevitable death to all quarters of the world; and many sovereigns paid secretly a pension to the Scheik, for the safety of their persons. The Knights Templars alone dared to defy his secret machinations and open force. Indeed, they were a permanent dispersed body, not to be cut off by massacres or assassinations. In 1090, Mâlek Shâh, third sultan of the Seljukians, of Iran, sent a messenger to Hassan, the Old Man of that period, calling on him for obedience, and accompanying the demand with threats in the case of his refusal. Hassan desired the ambassador might be admitted; and having assembled around him his troops, commanded one of them to draw his dagger, and plunge it into his own breast; the man, without the slightest hesitation, stabbed himself to the heart, and fell dead at his sovereign's feet. He then commanded a second to precipitate himself from the nearest tower; and was instantaneously obeyed. 'Go,' said Hassan, 'to the sultan, your master, and inform him, that I have no other reply to make him, excepting that I have seventy thousand troops equally obedient with those you have this day witnessed.' The sultan took the hint; and having, as Ebn Amed states, other matters in his hands, thought it not advisable to prosecute a war against this prince.

In 1192, the assassins penetrated the palace of Conrade, marquis of Moutserrat, who had displeased them, and put him to death. In 1213, they assassinated Lewis of Bavaria. Hul-lakn, a khan of the Mogul Tartars, in the year 655 of the Hegira, or 1254 of the Christian era, entered their country, and dispossessed them of several places. In 1257, the Tartars conquered them and killed their prince; but it was not till 1272, that they were totally extirpated; an achievement owing principally to the conduct and intrepidity of the Egyptian forces sent against them by the sultan Bibaris.

ASSAULT', v. & n. { Assilio, *assultum*. See ASSAULT'ING, n. } ASSAULT'ABLE, } ASSAIL.
ASSAULT'ER. }

Themselves at discord fell,
And cruel combat joined in middle space,
With horrible assault and fury fell. *Faerie Queen.*

It hath been ever a dangerous policy of Satan to assault the best; he knows that the multitude, as we say of bees, will follow their master. *Hall's Contemplations.*

After some unhappy assaults upon the prerogative

by the parliament, which produced its dissolution, there followed a composition. *Clarendon.*

Theories built upon narrow foundations, are very hard to be supported against the assaults of opposition. *Locke.*

The king granted the Jews, to gather themselves together, and to stand for their life, to destroy all the power, that would assault them. *Esther*, viii. 11.

Before the gates, the cries of babes new-born, Whom fate had from their tender mothers torn, *Dryden.*

Now cursed steel, and more accursed gold, Gave mischief birth, and made that mischief bold; And double death did wretched man invade, By steel assaulted, and by gold betray'd. *Id.*

Neither liking their eloquence, nor fearing their might, we esteemed few swords, in a just defence, able to resist many unjust assailters. *Sidney.*

This just rebuke inflamed the Lycian crew,

They join, they thicken, and th' assault renew; Unmov'd th' embodied Greeks their fury dare,

And fix'd, support the weight of all the war. *Pope. Homer's Iliad*, xii. 505.

ASSAULT, in law, is an attempt to beat another, and may be committed without touching him: as if one lifts up his cane or fist in a threatening manner at another; or strikes at him, but misses him; this is an assault, insultus, which Finch describes to be ‘an unlawful setting upon one's person.’ This also is an inchoate violence, amounting considerably higher than bare threats; and, therefore, though no actual suffering is proved, yet the party injured may have redress by action of trespass *vi et armis*, wherein he shall recover damages as a compensation for the injury.

ASSAULT, in the military art, a furious effort made to carry a fortified post, camp, or fortress, wherein the assailants do not screen themselves by any works: while the assault continues, the batteries cease, for fear of killing their own men.

ASSAY', v. & n. Fr. *essayer*, Ital. *assaggiare*, to try, examine, prove; to submit to experiment; to test.

One, that to bounty never cast his mind;

No thought of honour never did assay His baser breast. *Spenser.*

She heard with patience all, unto the end; And strove, to master sorrowful assay. *Faerie Queene.*

Gray and Bryan obtained leave of the general, a little to assay them; and so, with some horsemen, charged them home. *Hayward.*

What unweighed behaviour hath this drunkard picked out of my conversation, that he dares in this manner assay me? *Shakespeare.*

Be sure to find,

What I foretell thee; many a hard assay Of dangers, and adversities, and pains,

Ere thou of Israel's sceptre get fast hold. *Milton.*

The men he prest but late

To hard assays unfit, unsure y need; Yet arm'd to point, in well attempted plate. *Fairfax.*

She thrice assay'd to speak; her accents hung, And felt'ring dy'd unfinish'd on her tongue, Or vanish'd into sighs: with long delay Her voice return'd; and found the wonted way. *Dryden's Fables.*

ASSAYING, or ESSAYING, in metallurgy, is a method of ascertaining the actual quantity of pure gold or silver in a given metallic mass.

The term might, with equal propriety, be applied to ascertaining the presence and quantity of any metal, perfect or imperfect, in a mass of ore: but it has, from the universal value of the pure or precious metals, been gradually appropriated to the best modes of separating them from all admixture, the baser metals being considered by the assayer as of no value or consideration. We thus, therefore, apply the term in this paper; referring to the article METALLURGY, and the names of other metallic ores, in their alphabetical places, for more general observations.

Assaying is a species of chemical analysis, owing its origin probably, like the rest of the modern terms of chemistry, to the alchemy of darker ages. In this country the Liber Niger Seacarii, cited by Du Cange, attributes the first assay of money to the bishop of Salisbury, a royal treasurer, in the reign of Henry I. It states, that if the examined money was found to be deficient above sixpence in the pound, it was not deemed lawful money of the king, Du Cange, Gloss. i. p. 343. And thus is explained the first application of the terms arsas and arsuram, to money, in the Exchequer-book. But, it is clear, that some species of assay was practised by our ancestors as early as the Norman conquest, Domesday-book expressly stating, vol. i. f. 15, 16, that £65 of coined money was only worth £50 in pure silver, ‘according to the assay of the Mint.’ This is the passage: ‘Totum manerium T. R. E. et post valut xl. libras. Modo similiter xl. lib. Tamen reddit 2 lib. ad arsuram et pensum quæ valent lxv. lib.’ It also appears, by the same authority, that the king had this right of assay in several places beside the capital. It is remarkable, as Mr. Turner has observed, that we have no Anglo-Saxon gold coins, though numerous silver coins of that period have come down to us. That learned historian thinks, that both gold and silver uncoined, were, however, in circulation at this date. According to Dr. Henry's account of the conduct of Henry VIII. in respect to the coinage, it became indeed, most important that some system should be adopted for regulating the standard value of our coins.

‘That monarch,’ he remarks, ‘after he had squandered all his father's treasures, the grants he had received from parliament, and the great sums he had derived from the dissolution of the religious houses, began to diminish his coins both in weight and fineness. This diminution at first was small, in hopes, perhaps, that it would not be perceived; but, after he had got into this fatal career, he proceeded by rapid steps to the most pernicious lengths. In the thirty-sixth year of his reign, silver money of all the different kinds was coined, which had only one-half silver and the other half alloy. He did not even stop here; in the last year of his reign, he coined money that had only four ounces of silver and eight ounces of alloy in the pound weight; and the nominal pound of this base money was worth only 9s. 3*d.* of our present money. He began to debase his gold coins at the same time, and proceeded by the same degrees. But it would be tedious to follow him in every step. In this degraded and debased condition Henry

the Eighth left the money of his kingdom to his son and successor Edward the Sixth. This shameful debasement of the money of his kingdom, was one of the most imprudent, dishonorable, and pernicious measures of his reign: it was productive of innumerable inconveniences and great perplexity in business of all kinds; and the restoration of it to its standard purity was found to be a work of great difficulty,' Henry's History of Great Britain, vol. xii. p. 336, 337. It is worthy of observation, that since that period, we have had no such capricious and nefarious attempts; and the regulations of the royal British Mint may now be quoted as at once most scientific and effective.

The art, to which this paper is devoted, consists of two distinct branches or operations, the separation of alloy, or base metals, from the precious ores, accomplished by what is technically called cupellation; and the separation of the precious metals, gold, platina, and silver from each other, called quartation and parting.

The separation of gold, silver, and platina, from baser metals, is conducted by exposing the whole metallic mass, in which they are supposed to be contained, mixed with a certain portion of lead, to a strong heat, in a shallow crucible, made of burned bone, called a cupel; which is placed in a muffle or small earthen oven, fixed in the midst of a furnace. The lead now vitrifies, or becomes converted into a glassy calx, which dissolves the imperfect metals: and this calx, with those metals which it absorbs, soaks into the cupel, and leaves the precious metals in a state of purity. 'In proportion to the violence of the heat,' says Dr. Aikin, 'is the density of the fume, the violence with which it is given off, the convexity of the surface of the globule of melted matter, and the rapidity with which the vitrified oxide circulates (as it is termed), or falls down the sides of the metal. As the cupellation advances, the melted button becomes rounder, its surface becomes streaky with large bright points of the fused oxide, which moves with increased rapidity, till at last the globule, being now freed from all the lead and other alloy, suddenly lightens; the last portions of litharge on the surface disappear with great rapidity; showing the melted metal bright with iridescent colors, which directly after becomes opaque, and suddenly appears brilliant, clean, and white, as if a curtain had been withdrawn from it. The operation being now finished, and the silver left pure, the cupel is allowed to cool gradually, till the globule of silver is fixed, after which it is taken out of the cupel while still hot, and when cold weighed with as much accuracy as at first. The difference between the globule and the silver at first put in, shows the quantity of alloy, the globule being now perfectly pure silver, if the operation has been well performed. The reason of cooling the globule or button gradually is, that pure

silver, when congealing, assumes a crystalline texture, and if the outer surface is too suddenly fixed, it forcibly contracts on the still fluid part in the centre, causing it to spurt out in arborescent shoots, by which some minute portions are often thrown out of the cupel, and the assay spoiled.'

The assay of gold and silver is alike, it will be observed, throughout the process of cupellation. As lead is the medium required for the absorption of other metals, both the quality and quantity of that metal employed become important to ascertain. If it contains much silver, it will be easy to perceive a source of material error in the operations of the assayer. Lead revived from litharge contains only about half a grain in the pound weight, and is therefore preferred to lead immediately revived from the ore, which usually contains a larger quantity.

As to the proper quantity of lead, it is desirable at first to ascertain the comparative state of purity of the ingot to be assayed. In this country, such a judgment is generally formed from inspection of the color, hardness, tenacity, &c. of the metal, but formerly touch-needles were employed for this purpose. These, which are not entirely in disuse, consist of small bars of differently proportioned alloys, of known composition. If a streak is made with the ingot upon the surface of black flint, or basalt, a species of indurated slate, called by the ancients *βάσανος*, and still known by the name of basanite, or even upon a fragment of black pottery, by comparing the streaks with those made on the same stone from needles of known composition, the relative purity of the ingot may be inferred. 'Copper' says Dr. Aikin, 'the usual alloy of the fine metals, when taken singly, is found to require from ten to fourteen times its weight of lead for complete scorification on the cupel. Now, all admixtures of fine metal tend to protect the copper from the action of the litharge and the more obstinately, the greater the proportion of fine metal. So that copper, with three times its weight of silver (or 9 oz. fine), requires forty times as much lead as copper; with eleven parts of silver it requires seventy-two parts of lead, and the like in an increasing ratio. The following is the table of the proportions of lead required to different alloys of copper; of which a few points are founded on the above-mentioned experiments, and the rest filled up according to the estimated ratio of increase, being multiples of the assay integer 24 in arithmetical progression. In the three first columns is shown the absolute increase of the quantity of lead in alloys of decreasing fineness; in the three last columns will be seen the gradual diminution of the protecting power of fine metal against scorification, in proportion to the increase of alloy, shown by the decreasing quantity of lead required for the same weight of copper, under different mixtures.'

TABLE.

Silver	Cop-per		Lead	Ratio of increase		Cop-per		Silver		Lead	
23	with	1	requires	96	$\equiv 4 \times 24$	and hence	1	with	23	requires	96
22		2		144	$\equiv 6 \times 24$		1		11		72
20		4		192	$\equiv 8 \times 24$		1		5		48
18		6		240	$\equiv 10 \times 24$		1		3		40
16		8		288	$\equiv 12 \times 24$		1		2		36
14		10		336	$\equiv 14 \times 24$		1		1½		33
12		12		384	$\equiv 16 \times 24$		1		1		32
10		14		432	$\equiv 18 \times 24$		1		¾		30
8		16		480	$\equiv 20 \times 24$		1		½		30
6		18		528	$\equiv 22 \times 24$		1		¼		29
4		20		576	$\equiv 24 \times 24$		1		½		28
2		22		624	$\equiv 26 \times 24$		1		⅛		28

It should be remarked, however, that many assayers of good authority use proportions of lead considerably different from the above table; and the whole of the numbers here given may be considered as rather high, in regard to the quantity of lead. The assaying of gold, if that noble metal contained copper as an alloy, would be as simple and expeditious as that of silver; but all gold contains a portion of silver, which cannot be destroyed by cupellation: it may also contain platina; but this is not commonly found.

After it has passed the cupel, quartation and parting become necessary. The former consists in adding (generally) three parts of silver to the mass of supposed gold, and fusing them together. It is an object of importance to prevent the cornets from being broken, the result being less likely to be accurate when the gold is in fragments; and to prevent this, the quantity of silver used is no more than is absolutely necessary, it being found that the less the quantity of gold, compared to the silver, used in the assay, the more likely is the gold to be broken into pieces. ‘Suppose, for example,’ says Mr. Mushet, ‘that a gold assay is made from the integer, or pound, weighing twelve grains Troy, an addition of from twenty-four to thirty-six grains of pure silver is made in addition to the small portion already supposed to exist in the mass. This becomes thoroughly incorporated with the gold in the process of cupellation. The globule, or button, as soon as it is taken from the furnace, is passed between a pair of polished steel rollers, and drawn out into a thin lamina, or plate, of the thickness of a sixpence, and returned into the furnace to be annealed. After being kept in a red heat for some time, it is taken out and suffered to cool. It is then wound up into a cornet. This is put into a glass matrass, of the shape of an inverted cone, and with about twice or thrice its weight of very pure nitric acid. M. Vauquelin recommends it to be 1·25 specific gravity.’

The hot acid being very carefully poured from the matrass, warm water is added to wash any remains of silver from the gold, and the addition repeated until the water comes off perfectly clear. The cornets of gold, which are of a dull brown color, are then put according to their numbers

into small clay crucibles, into which they are allowed gently to fall by inverting the matrass, with a portion of water in it, which breaks their fall, and also collects any grains of gold that may be in the matrass. The water is then poured off, and they are put into the furnace, and annealed under a bright cherry heat. When cooled, the pieces of gold exhibit their beautiful characteristic lustre, and possess all the softness and flexibility of that metal. The weight of the original metallic mass before cupellation and in the subsequent stages, compared with the final weight now ascertained, indicates the degree of fineness of the ingot, or ore, of which it is a part. In estimating or expressing this fineness in regard to gold, the whole mass spoken of is supposed to weigh twenty-four carats of twelve grains each, either real, or merely proportional, like the assayer’s weights; and the pure gold is called fine. Thus, if gold be said to be twenty-three carats fine, it is to be understood, that in a mass weighing twenty-four carats, the quantity of pure gold amounts to twenty-three carats.

The assay report of gold, says the official gentleman we have quoted above, is made according as it is better or worse than standard. The standard of our gold coin is twenty-two carats fine, and two carats alloy. If, by assay, an ingot of gold was found to contain twenty-one carats of fine gold, it would be reported worse one carat, the mass containing a carat of alloy more than the proportion of two carats to twenty-two carats fine. If the ingot weighed fifteen pounds Troy, there would be deducted from the gross weight one carat, or 240 grains Troy, reducing the standard of the mass to 14 lbs. 11 ozs. 10 dwt. If, on the contrary, the mass was found to contain twenty-three carats fine gold, it would be reported one carat better than standard; and this carat would be added to the gross weight of the ingot, which we have supposed to weigh fifteen pounds Troy, and would be called 15 lbs. 0 oz. 10 dwt. of standard gold. When the gold assay pound or integer is only twelve grains, the quarter assay grain weighs only $\frac{1}{3}$ part of a Troy grain. This will show how delicate the scales must be by which the assayer works in order to obtain accuracy. In the royal mint the scales of the assayers will be sensibly affected even with

the $\frac{1}{768}$ th part of a Troy grain. When the emperor of Russia lately visited the mint, he was particularly struck with the extreme delicacy of the assay scales of Mr. Bingley, the king's assay-master. That gentleman requested the favor of his imperial majesty to put one of the hairs of his head into the scale, which he did, and, to the great satisfaction of his majesty, it very sensibly affected the equilibrium of the beam.'

It is necessary to be careful that the silver used in this last process should contain no gold, otherwise a source of material error would arise in the operation; and, as silver generally contains a small portion of gold, the best assayers use that which is revived from a precipitation of the nitrate of silver. This nitrate of silver is precipitated by immersing in it plates of copper: it may also be recovered by a solution of common salt, which converts the silver into luna cornea, of which, when washed and well dried, 100 parts contain seventy-five of silver. The accuracy of the assay may also be proved by this process. The luna cornea, however, is more difficult to reduce to the metallic state.

Many dealers in bullion (the bank of England we believe uniformly) refuse to purchase any foreign gold bullion, until it has been remelted by refiners or meltors on whom Integrity they can rely.

Platina, on account of its great value, is not likely to be used in debasing silver; but it may be fraudulently added to gold. Like gold and silver, it resists the action of lead upon the cupel; but an expert assayer will recognise its presence by the very different appearance which it gives to the button of metal in fusion. This is less perfect; a much greater heat is required; and the color less bright; and, in a very small proportion, it gives to the gold a strong tendency to crystallisation. Nothing is required for its separation but to proceed exactly as in a gold assay; and, by reducing the lamina of metal very thin, to form the cornet, the platina, though alone insoluble in nitric acid, may, with the silver, be totally removed from the gold.

Some idea of the delicacy required through the whole of the foregoing operations may be formed from an authentic statement, that in our national mint an assay of twenty grains is relied on for giving the value of a mass of gold of fifteen pounds, or of silver of sixty pounds in weight.

The Annales de Chimie, vol. vi. p. 64, contain some very interesting details of recent attempts of the French government to establish an accurate assay of gold. The general result is as follows, nearly in the terms of the experimenters:—

Six principal circumstances appear to affect the operation of parting: namely, the quantity of acid used in parting, or in the first boiling; the concentration of this acid; the time employed in its application; the quantity of acid made use of in the reprise, or second operation; its concentration; and the time during which it is applied. From the experiments it has been shown, that each of these unfavorable circumstances might easily occasion a loss of from the half of a thirty-second part of a carat, to two thirty-second parts. The writers explain their technical language by observing, that, the whole

mass consisting of twenty-four carats, this thirty second part denotes $1-768$ th part of the mass. It may easily be conceived, therefore, that if the whole six circumstances were to exist, and be productive of errors falling the same way, the loss would be very considerable.

It is indispensably necessary, therefore, that one uniform process should be followed in the assays of gold; and it is a matter of astonishment, that such an accurate process should not have been prescribed by government for assayers in an operation of such great commercial importance, instead of every one being left to follow his own judgment. The process recommended in the report before us is as follows:—

Twelve grains of the gold intended to be assayed must be mixed with thirty grains of fine silver, and cupelled with 108 grains of lead. The cupellation must be carefully attended to, and all the imperfect buttons rejected. When the cupellation is ended, the button must be reduced by lamination into a plate of one inch and a half, or rather more, in length, and four or five lines in breadth. This must be rolled up upon a quill, and placed in a matrass capable of holding about three ounces of liquid, when filled up to its narrow part. Two ounces and a half of very pure aqua-fortis, of the strength of twenty degrees of Baume's areometer, must then be poured upon it; and the matrass being placed upon hot ashes, or sand, the acid must be kept gently boiling for a quarter of an hour; the acid must then be cautiously decanted, and an additional quantity of one ounce and a half must be poured on the metal, and slightly boiled for twelve minutes. This being likewise carefully decanted, the small spiral piece of metal must be washed with filtered river water, or distilled water, by filling the matrass with this fluid. The vessel is then to be reversed, by applying the extremity of its neck against the bottom of a crucible of fine earth, the internal surface of which is very smooth. The annealing must then be made, after having separated the portion of water which had fallen into the crucible; and, lastly, the annealed gold must be weighed. For the certainty of this operation, two assays must be made in the same manner, together with a third assay upon gold of twenty-four carats, or upon gold the fineness of which is perfectly and generally known.

No conclusion must be drawn from this assay, unless the latter gold should prove to be of the fineness of twenty-four carats exactly, or of its known degree of fineness; for, if there be either loss or surplus, it may be inferred, that the other two assays, having undergone the same operation, must be subject to the same error. The operation being made according to this process, by several assayers, in circumstances of importance, such as those which relate to large fabrications, the fineness of the gold must not be depended on, nor considered as accurately known, unless all the assayers have obtained a uniform result without communication with each other. The authors observe, however, that this identity must be considered as existing to the accuracy of half of the thirty-second part of a carat. For notwithstanding every possible precaution or

uniformity, it very seldom happens that an absolute agreement is obtained between the different assays of one and the same ingot; because the ingot itself may differ in its fineness in different parts of its mass.

The assaying of silver does not differ from that of gold, excepting that the parting operation is not necessary. A certain small portion of the silver is absorbed by the cupel and the more when a larger quantity of lead is used, unless the quantity of lead be excessive; in which case most of it will be scorified before it begins to act upon the silver. Messrs. Hellot, Tillet, and Macquer, from their experiments made by order of the French government, have ascertained, that four parts of lead are requisite for silver of eleven pennyweights twelve grains fine, or containing this weight of pure silver, and twelve grains of alloy, in twelve pennyweights; six parts of lead for silver of eleven pennyweights; eight parts lead for silver of ten pennyweights; ten parts lead for silver of nine pennyweights: and so on in the same progression. The following is the assay table of M. D'Arct:

Titles of the Silver.	Quantities of copper in the alloy.	Doses of lead necessary, the weight of silver being 1.	Relation between the lead and copper.
Silver at 1000	0	3-10ths.	
950	50	3	70 to 1
900	100	7	60—1
800	200	10	50—1
700	300	12	40—1
600	400	14	35—1
500	500	from 16 to 17	32—1
400	600	16—17	26-66—1
300	700	16—17	22-857—1
200	800	16—17	20—1
100	900	16—17	17-77—1
Pure copper,	1000	16—17	16—1

This table supposes, that the title of the silver to be assayed is known; but when it is not, it may be determined approximately, by exposing in the cupel 0·1 part of this silver with 1 of lead. French gold and silver coin contains 1-10th of copper united to the precious metal. British silver coin consists of 12½ silver and 1 copper; our gold coin contains 11-12ths of gold. The remainder is either copper, or a mixture of silver and copper.

In our plate entitled ASSAYING we give the assay furnace and its instruments, as used at the Royal Mint, and Goldsmith's Hall, London.

Fig. 1. AAAA is a front elevation of the assay furnace; *a* *a* one of two iron rollers on which the furnace rests; *b* the ash-pit; *c* *c* the ash-pit dampers, moving in a horizontal direction towards each other, for regulating the draught of the furnace; *d* the door, or opening by which the cupels are introduced into the muffle; *e* a movable funnel or chimney, by which the draught of the furnace is increased.

BBBB, Fig. 2, is a perpendicular section of fig. 1; *a* *a* ends of the rollers; *b* the ash-pit; *c* one of the ash-pit dampers; *d* the grate; *e* the

plate upon which the muffle rests, and which is covered with loam nearly one inch thick; *f* a section of the muffle representing the situation of the cupels; *g* the mouth-plate, and upon it are laid pieces of charcoal, which during the process are ignited, and heat the air that is to pass over the surface of the cupels; *h* the interior of the furnace, exhibiting the fuel.

The total height of the furnace is two feet six inches and a half; from the bottom to the grate six inches; the grate, muffle, plate, and bed of loam with which it is covered three inches; from the upper surface of the grate to the commencement of the funnel, *c*, is six inches. The square of the furnace which receives the muffle and fuel is eleven inches and three-quarters by fifteen inches. The external sides of the furnace are made of plates of wrought iron, and are lined with a two-inch fire brick.

Fig. 3 is the muffle, a sort of small oven, made of crucible clay, and open at one end. On the floor of the muffle the cupels are ranged in order, so that by a corresponding board as a register, the position of each may be preserved with reference to their respective contents. At the sides of the muffle are three or four slits to allow of the circulation of the air, which is essential to the process. It is usual to spread over the floor of the muffle a thin layer of sand, or powdered chalk, to prevent the fused oxide of lead which may penetrate the cupel, from cementing it to the bottom of the muffle.

Fig. 4 is the muffle plate on which it rests in the furnace.

Fig. 5 is the door seen at *d* in fig. 1, with *n* its sliding mouth-plate.

Fig. 6 represents the mode of closing the mouth of the furnace with cylinders of charcoal, which being ignited, heat the air, before it arrives at the surface of the metal in the cupels.

Fig. 7 two cupels; they are made of bones calcined and reduced to a moderately fine powder, which is mixed up with water so as to form a paste. The shape is produced by ramming this paste into truncated conical moulds, a cavity is then formed at the upper surface of each by means of a round ended pestle or rammer. The cupel is disengaged from the mould, and suffered to become thoroughly dry in the open air before it can be made use of for an assay. The core of ox horns is considered the best substance for producing the phosphate of lime for cupels. Those commonly employed in the mint are one inch in diameter by seven-eighths in depth.

Fig. 8 the teaser for cleaning the grate.

Fig. 9 a larger teaser, which is introduced at the top of the furnace, for keeping a complete supply of charcoal around the muffle.

Fig. 10 the tongs used for charging the assays into the cupels.

Fig. 11 represents a board of wood used as a register, and is divided into forty-five equal compartments, upon which the assays are placed previous to their being introduced into the furnace. When the operation is performed, the cupels are placed in the furnace in situations corresponding to these assays on the board; by these means all confusion is avoided, and with-

out this regularity, it would be impossible to preserve the accuracy which the delicate operation of the assayer requires.

ASSAY-MASTER, an officer, under certain corporations, entrusted with the care of making true touch, or assay, of gold and silver; and giving a just report of the goodness or badness thereof. Such is the assay-master of the mint in the Tower, called also assayer of the king.

The assay-master of the goldsmith's company is an assistant-warden, called also a touch-warden, appointed to survey, assay, and mark all the silver-work, &c. committed to him. There are also assay-masters, appointed by statute, at York, Exeter, Bristol, Chester, Norwich, Newcastle, and Birmingham, for assaying wrought plate. The assay-master is to retain eight grains of every pound Troy of silver brought to him; four whereof are to be put in the pix, or box of deal, to be re-assayed the next year; and the other four to be allowed him for his waste and spillings. 12 and 13 Will. III. c. 4. 1 Ann. c. 9.

Note. The number of pennyweights set down in the assay-master's report, is to be accounted as per pound, or so much in every pound of twelve ounces Troy. For every twenty pennyweights, or ounce Troy, the silver is found by the assay to be worse than standard, or sterling, sixpence is to be deducted; because every ounce will cost so much to reduce it to standard goodness, or to change it for sterling. In gold, for every carat it is set down to be worse than standard, you are to account that in the ounce Troy it is worse by so many times 3s. 8d. And for every grain it is set down worse, you must account it worse by so many times 11d. in the ounce Troy. And for every half grain, 5½d.; for so much it will cost to make it of standard goodness, &c.

ASSAY-BALANCE, a balance used in the operation of assaying. See BALANCE.

ASSAY OF WEIGHTS AND MEASURES, often signifies the trial or examination of common weights and measures by the clerk of a market.

ASSECURE, } Barbarous Lat. *assecurare*.
ASSECUR'ANCE, } rare, Lat. *securus*, to give
ASSECURA'TION, } assurance.

Can never mischief end as it begun;
But being once out, must farther out of force?
Think you that any means under the sun
Can assure so indirect a course?

Daniel. Civil War. bk. iii. p. 473.

But how far then reaches this *assurance*? So far as to exclude all fears, all doubting and hesitation? Neither of these. *Bishop Hall's Sermons.*

ASSECUTION. Lat. *assequor*, *assecutus*, from *ad* and *sequor*, the act of following up, obtaining.

By the canon law, a person after he has been in full possession of a second benefice, cannot return to his first, because it is immediately void by his *assecution* of a second. *Ayliffe's Parergon.*

ASSELYN (John), a famous Dutch painter,
He distin-

painting landscapes, in which Claude Lorraine was his model. Twenty-four of his landscapes have been engraved by Perelle, and sold at high prices. He died at Amsterdam in 1660.

ASSEMANI, I. S. and S. E. two learned librarians of the Vatican, in the seventeenth and eighteenth centuries. Joseph Simon was born at Rome 1687, and died 1768. He wrote *Bibliotheca Orientalis Clementino Vaticana, Romæ*, 1719-28, 4 vols. folio, affording ample proof of his learning in the numerous notices it contains of Syriac, Arabic, and Persian manuscripts, with lives of their authors. S. Ephræm, Syri, *Opera omnia*, qua extant, *Grace, Syriace, et Latine, Romæ*, 1732-34, 6 vols. folio; *Italica Historiae Scriptores ex Bibl. Vat., Roma, 1751-53*, 4 vols. 4to; *Kalendaria Ecclesiæ Universæ*, &c. *Romæ*, 1755-57, 6 vols. 4to. Assemanni, S. E. nephew of the foregoing, wrote *Bibliothecæ Mediceo Laurentinae et Palatinae Codd. MSS. Orientalium Catalogus, Florentia, 1742*, 2 vols. folio; *Acta Sanctorum Martyrum Oriental et Occidental, Romæ*, 1748, 2 vols. folio.

ASSEM'BLENCE. Fr. *semblée*, a likeness. See SEMBLANCE.

FALST. Will you tell me, Master Shallow, how to chuse a man? Care I for the limbe, the thewes, the stature, bulke, and bigge *assemblance* of a man? Give me the spirit, Master Shallow.

Shakespeare. Henry IV. part ii.

ASSEMBLE , <i>v. & n.</i>	Fr. <i>assembleur</i> , from <i>Assem'blage</i> ,	
	the Latin <i>ad</i> , to, and <i>simul</i> , together. To	
ASSEM'BLANCE ,	ASSEM'BLER ,	bring together, or in
	ASSEM'BLING ,	one place; to collect;
	ASSEM'BLY.	to convene.

A rout of people there *assembled* were,
Of every sort and nation under sky,
Which, with great uproar, pressed to draw near
To the upper part, where was advanced high

A stately seat of sovereign majesty. *Spenser.*

Mahomet made the people believe that he would call a hill to him; and from the top of it offer up his prayers for the observers of his law. The people *assembled*; Mahomet called the hill to come to him, again and again; and, when the hill stood still, he was never a whit abashed, but said; ' If the hill will not come to Mahomet, Mahomet will go to the hill.'

Lord Bacon's Essays.

These men *assembled*, and found Daniel praying.
Daniel.

And he shall set up an ensign for the nations, and shall *assemble* the outcasts of Israel, and gather together the dispersed of Judah. *Isaiah xi. 12.*

He wonders for what end you have *assembled*
Such troops of citizens to come to him.

Shakespeare.

Assemble all in choirs, and with their notes
Salute and welcome up the rising sun. *Otway.*

O Hartford (fitted, or to shine in courts
With unaffected grace, or walk the plains,
With innocence and meditation join'd
In soft *assemblage*) listen to my song! *Thomson.*

The ASSEMBLY OF DIVINES at Westminster,
was an association of ministers and others, sum-

horses. He travelled into France and Italy; and was much pleased with the manner of Bamboccio, which he always followed, except in the

government and liturgy of the church on ~~the~~ land, and for vindicating and clearing the said church from false aspersions and interpretations.

It also met expressly according to the words of the covenant, ‘for the extirpation of pre-lacie, that is church-government by arch-bishops, bishops, their chancellors, and commissaries, deans and chapters, archdeacons and all other ecclesiastical officers.’ This assembly consisted of 121 divines and thirty laymen, ‘celebrated in their party,’ says Mr. Hume, ‘for piety and learning.’ The leading parties were the Presbyterians, Erastians, and Independents. The works of the assembly, besides some letters to foreign churches, and occasional admonitions were, 1. Their humble Advice to Parliament, for Ordination of Ministers, and settling the Presbyterian Government. 2. A Directory for Public Worship. 3. A Confession of Faith. 4. A larger and a shorter Catechism. 5. A Review of some of the Thirty-nine Articles. Both the larger and shorter Assembly’s catechism, are largely in use at the present time among the English Calvinistic dissenters.

ASSEMBLIES of the clergy are otherwise called convocations, synods, councils. The annual meeting of the church of Scotland is called the General Assembly; in which his Majesty is represented by his commissioner, generally a Scottish nobleman, but who has no voice in the deliberations: his duty being confined to the calling and dissolution of the meeting, which he does in the name of his Majesty, whilst the Moderator does the same in the name of the Lord Jesus Christ. This assembly possesses the highest authority in the church of Scotland; a presbytery, composed of fewer than twelve parishes, sends two ministers and one ruling elder to the assembly; if it contains between twelve and eighteen ministers, it sends three of these, and one ruling elder; if it contains between eighteen and twenty-four ministers, it sends four ministers and two ruling elders; and of twenty-four ministers, it sends five with two ruling elders. Every royal burrough deputes one ruling elder, and Edinburgh two; their election must be attested by the kirk-session of their respective burroughs. Every university sends one commissioner from its own body. The commissioners are chosen annually six weeks before the meeting of the assembly; and the ruling elders are often men of the first eminence for rank and talents.'

ASSEMBLIES of the Roman people were called comitia.

ASSEMBLIES OF THE STATES. Under the Gothic governments, the supreme legislative power was lodged in an assembly of the states of the kingdom held annually for the like purposes as our parliaments. There were some feeble remains of them in France and Poland before the late revolutions and counter-revolutions.

ASSEMBLY, in the military art, the second beating of a drum before a march; at which the soldiers strike their tents, roll them up, and stand to arms. See DRUM.

ASSENS, a bailiwick and town of Denmark, on the west coast of the island of Funen, which carries on a considerable trade in corn. It is also called Asnes, which signifies the holy promontory. A battle was fought in it, in 1536, wherein Christian III. obtained a decisive victory

over Christian II. Here is a ferry across the little Belt to Holstein. Long. 9° 54' E., lat. 55° 20' N.

ASSENT^{v. & n.}, Lat. *assentior*, from *ad*, ASSENT^{ACTION}, } and *scutio*, to think to, to ASSENT^{AUTOR}, } be of the same opinion. ASSENT^{ER}, } To agree to what is proposed, to bring one's ASSENT^{MENT}. } mind to a thing, to comply. Assentation is synonymous with flattery; obsequiousness.

And the Jews also assented, saying that these things were so. *Acts xxiv. 9.*

Their arguments are but precarious, and subsist upon the charity of our assentments.

Brown's Vulgar Errors.

To urge any thing upon the church; requiring thereunto that religious *assent* of Christian belief, wherewith the words of the holy prophets are received, and not to show it in scripture; this did the Fathers evermore think unlawful, impious, and execrable.

Hooker.

The evidence of God’s own testimony, added unto the natural *assent* of reason concerning the certainty of them, doth not a little comfort and confirm the same.

Id.

Without the king’s *assent* or knowledge,

You wrought to be a legate.

Shakspeare.

Faith is the ~~trust~~ to any proposition, not thus made out by the deduction of reason, but upon the credit of the proposer.

Locke.

All the arguments on both sides must be laid in balance; and, upon the whole, the understanding determine its *assent*.

Id.

Man is the world’s high-priest, he doth present

The sacrifice for all, while they below,

Unto the service mutter an *assent*,

Such as springs use, that fall, and winds that blow.

Herbert.

One would think that hell should have little need of the fawning *assentation* of others, when men carry so dangerous parasites in their own bosoms; but sure, both together must needs help to people that region of darkness.

Bishop Hall's Soliloquies.

He ceased; th’ assembled warriors all *assent*,

All but Atrides.

Cumberland.

Precept gains only the cold approbation of reason, and compels an *assent* which judgment frequently yields with reluctance, even when delay is impossible.

Hawkesworth.

The ROYAL ASSENT is the approbation given by the king in parliament, to a bill which has passed both houses, after which it becomes a law.

The royal assent may be given in two ways.¹

In person; when the king comes to the house of peers, in his crown and royal robes, and sending for the commons to the bar, the titles of all the bills that have passed both houses are read; and the king’s answer is declared by the clerk of the parliament in Norman-French. If the king consents to a public bill, the clerk usually declares, ‘le roy le veut; the king wills it so to be;’ if to a private bill, ‘soit fait comme il est desire; be it as it is desired.’ If the king refuses his assent, it is in the gentle language of ‘le roy s’avisera; the king will advise upon it.’ When a money-bill, or bill of supply, is passed, it is carried up and presented to the king by the speaker of the house of commons; and the royal assent is thus expressed ‘le roy remercie ses loyal sujets, accepte leur benevolence, et aussi le veut;

the king thanks his loyal subjects, accepts their benevolence, and wills it so to be.'

In case of an act of grace, which originally proceeds from the crown, and has the royal assent in the first stage of it, the clerk of the parliament thus pronounces the gratitude of the subject; 'les prelats, seigneurs, et commons, en ce present parlement assemblés, au nom de tous vous autres sujets, remercient tres humblement votre majeste, et prient a Dieu vous donner en sante bone vie et longue; the prelates, lords, and commons, in this present parliament assembled, in the name of all your other subjects, most humbly thank your majesty, and pray to God to grant you health and wealth long to live.'

2. By the statute 33 Hen. VIII. c. 21., the king may give his assent, by letters patent, under his great seal, signed with his hand, and notified in his absence to both houses, assembled together in the high house. And when the bill has received the royal assent in either of these ways it is then, and not before, a statute or act of parliament: copy of which is usually printed at the king's press, for the information of the whole land. See Blackst. Com. book i. chap. 2.

ASSER, or ASCE, a Jewish rabbi of the fifth century, who, with other learned rabbins, compiled the collection of Hebrew traditions called the Babylonian Talmud. This was printed at Leyden, 1630, in 4to.; but the most complete edition is one published in 1744, at Amsterdam, twelve volumes folio, with an ample commentary. Asser died in 427, aged seventy-four.

ASSER (John), or Asserius Mennevensis, (i. e. Asser of St. David's), bishop of Sherborne in the reign of Alfred the Great. He was born in Pem-broke-shire, South Wales; and educated in the monastery of St. David's. By his assiduous application he soon acquired universal fame as a person of profound learning and great abilities. Alfred the munificent patron of genius, about the year 890, sent for him to his court, then held at Dean in Wiltshire. He was so charmed with Asser, that he made him his preceptor and companion; appointed him abbot of two or three different monasteries; and at last promoted him to the see of Sherborne, where he died in 910. He is said to have been principally instrumental in persuading the king to restore the university of Oxford to its pristine dignity; and wrote *De Vitâ et Rebus Gestis Alfredi*, &c. Lond. 1574, published by archbishop Parker, in the old Saxon character, at the end of Walsingham Hist.—Francf. 1602, fol. Oxf. 1722, 8vo. Many other works are ascribed to this author by Gale, Bale, &c. but on very doubtful authority.

ASSERIA, ASSESIA, or ASISIA, an ancient town of Liburnia, now in ruins. Pliny, having specified the Liburnian cities that were obliged to attend the congress of Scardonia, adds to the catalogue the free Asserians, immunesque Asseriates; a people who created their own magistrates, and were governed by their own municipal laws.

ASSERIDA, in botany, a name given by the people of Guinea to a kind of shrub, the leaves of which being chewed, are a cure for the colic.

ASSERT', ASSERT'ION, ASSERT'ION, ASSERT'IVE, ASSERT'IVELY, ASSERT'TOR, ASSERT'TORY. } *Assero, assertum, to kri:*
to, to sew to. To abide by,
to bear the consequence of
an opinion, to hold, to main-
tain, to affirm.

That tongue

Inspir'd with contradiction, durst oppose
A third part of the gods, in synod met,
Their deities to assert.

Milton.

Among th' assertors of free reason's claim,
Our nation's not the least, in worth or fame,
The world to Bacon does not only owe
It's present knowledge, and its future too.

Dryden's Epistles.

Faithful assertor of thy country's cause,
Britain with tears shall bathe thy glorious wound.

Prior.

It is an usual piece of art to undermine the autho-
rity of fundamental truths, by pretending to shew
how weak the proofs are which their assertors employ
in defence of them.

Attbury.

He was so fond of the principles he undertook
to illustrate, as to boast their certainty; proposing
them, not in a confident and assertive form, but as prob-
abilities and hypotheses.

Glanville.

The Epicureans contented themselves with the de-
nial of a Providence, asserting at the same time the
existence of gods in general, because they would not
shock the common belief of mankind.

Addison.

We, as it were, lean forward with surprise and
trembling, to behold the human soul collecting its
strength, and asserting a right to superior fates.

Usher.

When the great soul buoys up to this high point,
Leaving gross nature's sediments below,
Then, and then only, Adam's offspring quits
The sage and hero of the fields and woods,
Asserts his rank and rises into man.

Young.

It is an erect countenance; it is a firm adherence
to principle; it is a power of resisting false shame
and frivolous fear, that assert our good faith and ho-
nor, and assure us of the confidence of mankind.

Burke.

Sophocles also, in a fragment of one of his tragedies, asserts the unity of the supreme being.

Cumberland.

But, lo! from high Hymettus to the plain,
The queen of night asserts her silent reign.

Lord Byron's Corsair.

ASSESS', v. & n. Ital. *assessare*, to set to,
ASSESS'IONARY, } impose a tax. Legally
ASSESS'MENT, } done by a sitting or coun-
ASSESS'OR. } cil, and agreement of those
authorised to impose it. Assessor is a legal ad-
viser to a magistrate, sitting by him on the
bench.

To his Son,

Th' assessor of his throne, he thus began. Milton.

Twice stronger than his sire, who sat above,
Assessor to the throne of thund'ring Jove. Dryden.

Minos, the strict inquisitor, appears;
And lives and crimes, with his assessors, hears:
Round, in his urn, the blended balls he rolls;
Absolves the just, and dooms the guilty souls. Id.

What greater immunity and happiness can there
be to a people, than to be liable to no laws, but what
they make themselves? To be subject to no contri-
bution, assessment, or any pecuniary levy whatsoever,
but what they vote, and voluntarily yield unto them-
selves.

Howell.

One of the answers of the jury, upon their oaths, at the *assesmentary* court, I have inserted.

Curew's Survey of Cornwall.

Pausanias sat the judge;

Callicles and Aemnestus wise,
His two *assessors.*

Glover's Athenaid.

ASSETS, in law, are either real or personal. Where a man hath lands in fee simple, and dies seized thereof, the lands which come to his heir are assets real; and where he dies possessed of any personal estate, the goods which come to the executors are assets personal. Assets are also divided into assets per descent, and assets intermaines.

1. ASSETS BY DESCENT are where a person is bound in an obligation, and dies seized of lands which descend to the heir, the land shall be assets, and the heir shall be charged as far as the land to him descended will extend.

2. ASSETS INTER MAINES are when a man indebted makes executors, and leaves them sufficient to pay his debts and legacies; or where some commodity or profit ariseth to them in right of the testator, which are called assets in their hands. This term is also applied commercially to any available property for the payment of a man's debts.

ASSEVER'ER, { Lat. *assevero*; *ad*, and *se-*
ASSEVER'ATION. { *verus*. To say or affirm severely or solemnly; to assure; to maintain seriously.

GUISE. You must, you will, and smile upon my murder.

MARMONTIER. Therefore, if you are conscious of a breach,
Confess it to me: lead me to the king,
He has promis'd me to conquer his revenge,
And place you next him; therefore, if you're right,
Make me not fear it by *asserations*,
But speak your heart, and O resolve me truly.

Dryden. Duke of Guise.

'I will come and some of you shall see me coming.' Can it be supposed that in such an *asseration*, the word to 'come' may bear two different senses.

Horsley's Sermons.

ASSIDEANS, or CHASIDÆANS; from the Heb. חסידין, chasidim, merciful, pious; those Jews who resorted to Mattathias to fight for the law of God and the liberties of their country. They were men of great valor and zeal, having voluntarily devoted themselves to a more strict observation of the law than other men. For after the return of the Jews from the Babylonish captivity, there were two sorts of men in their church; those who contented themselves with that obedience only which was prescribed by the law of Moses, and who were called Zadikim, i. e. the righteous; and those who, over and above the law, superadded the constitutions and traditions of the elders, and other rigorous observances: these latter were called Chasidim, i. e. the pious. From the former sprung the Samaritans, Sadducees, and Caraites; from the latter, the Pharisees and the Essenes.

ASSIDENT SIGNS, in medicine, are symptoms which usually attend a disease but not always; hence differing from pathognomonic signs, which are inseparable from the disease: e. g. in the pleurisy, a pungent pain in the side; in an acute fever, difficulty of breathing, &c collectively

taken, are pathognomonic signs; but that the pain extends to the hypochondrium or clavicle, or that the patient lies with more ease on one side than on the other, are assident signs.

ASSID'UATE, } Lat. *assidueo*, to sit down
ASSID'UITY, } at any thing constantly or
ASSID'UOUS, } daily. Constant in application,
ASSID'UOUSLY. } unwearied, diligent, sedulous.

And if by pray'r
Incessant I could hope to change the will
Of him who all things can, I would not cease
To weary him with my *assiduous* cries. *Milton.*
The most *assiduous* tale-bearers, and bitterest revilers, are often half-witted people.

Government of the Tongue.

In summer, you see the hen giving herself greater freedoms, and quitting her care for above two hours together; but in winter, when the rigour of the season would chill the principles of life, and destroy the young one, she grows more *assiduous* in her attendance, and stays away but half the time.

Addison.

Each still renews her little labour,
Nor justles her *assiduous* neighbour. *Prior.*
We observe the address and *assiduity* they will use to corrupt us. *Rogers.*

The habitable earth may have been perpetually the drier, seeing it is *assiduously* drained and exhausted by the seas. *Bentley.*

A scholar is industrious, who doth *assiduously* bend his mind to study for getting knowledge.

Barrow's Sermons.

Often as she mounts
Or quits the car, his arm her weight sustains
With trembling pleasure. His *assiduous* hand
From purest fountains wafts the living flood.

Glover. Leonidas, book viii. p. 57.

ASSIDUI, in Roman antiquity, volunteers who served in the army at their own expense.

ASSIDUUS, or ABSIDUUS, from *as*, money, among the Romans, denoted a rich or wealthy person. Hence we meet with *assiduous* sureties, *assidui* fide-jussores. When Servius Tullius divided the Roman people into five classes, according as they were assessed, the richer sort who contributed *asscs* were denominated *assidui*; and as these were the chief people of business who attended all the public concerns, those who were diligent in attendances came to be denominated *assidui*.

ASSIEGE'. Fr. *assieger*, to sit down before. To sit down before a town, to besiege.

Swiche wondring was ther on this hors of brass,
That sin the gret *assege* of Troye was,
Ther as men wondred on an hors also,
Ne was ther swiche a wondring, as was tho.

Chaucer. The Squier's Tale, vol. i. p. 431.

On th' other side th' *assieg'd* castles ward
Their stedfast arms did mightily maintaine.

Spenser.

I leave what glory virtue did attain,
At th'ever memorable Agincourt.
I leave to tell, what wit, what pow'r did gain
The *assiey'd* Roan, Caen, Dreux; or in what sort.

Daniel. Civil War, book v.

ASSIENTO, Span. a contract. The first of this kind was made by the French Guinea Company; and, by the treaty of Utrecht, transferred to the English, who were to furnish 4800 negroes to Spanish America annually.

ASSIGN', v. & n. Lat. *assigno*; *ad*, and *signo*, to mark or sign.
ASSIGN'ABLE, To mark off, to appoint,
ASSIGN'A'TION, to set apart, to appropriate
ASSIGNEE', to a particular use, to
ASSIGN'ER, allot, to bring forward as
ASSIGN'MENT. a cause or reason.

At last, as forced by false Ulysses crye,
 Of purpose he brake fourth, *assigning* me
 To the altar. *Surrey.*

He *assigned* Uriah unto a place where he knew that
 valiant men were. *2 Sam. xi. 16.*

The two armies were *assigned* to the leading of two
 generals, both of them rather courtiers assured to the
 state, than martial men. *Bacon.*

The only thing which maketh any place publick,
 is the publick *assignment* thereof unto such duties. *Hooker.*

Thus most invectively he (Jaques) pierceth through
 The body of the country, city, court,
 Yea, and of this our life, swearing that we
 Are more usurpers, tyrants, and what's worse
 To fright the animals, and to kill them up
 In their *assigned* and native dwelling-place.

Shakespeare. As You Like It.

The cause of love can never be *assigned*,
 'Tis in no face, but in the lover's mind. *Dryden. Tyrannic Love.*

Both joining,
 As join'd in injuries, one enmity
 Against a foe by doom express ~~join'd~~ us,
 That cruel serpent. *Milton.*

This institution, which *assigns* it to a person whom
 we have no rule to know, is just as good as an *assignment* to nobody at all. *Locke.*

The lovers expected the return of this stated hour
 with as much impatience as if it had been a real *assignment*. *Spectator.*

True quality is neglected, virtue is oppressed, and
 vice triumphant. The last day will *assign* to every
 one a station suitable to the dignity of his character. *Addison.*

The gospel is at once the *assigner* of our tasks, and
 the magazine of our strength. *Decay of Piety.*

ASSIGN, OR ASSIGNEE, in common law, a person
 to whom a thing is assigned or made over. The
 word assign is said to have been introduced in
 favor of natural children; who, because they can-
 not pass by the name of heirs, are included under
 that of assigns. For Assignee, in bankruptcy,
 see BANKRUPTCY.

Assignable Magnitude, in geometry, any
 finite magnitude.

Assignable Ratio, the ratio of finite quanti-
 ties.

ASSIGNATS, a species of paper currency,
 issued by the government of France, for sums of
 different values, to the amount of many thousand
 millions of livres, to support the credit of the re-
 public during the course of the revolution.

Assignment, may be more accurately de-
 fined the act of transferring the interest or pro-
 perty a man has in any thing; or of appointing
 or setting over a right to another.

Assignment of a Dowry, is the setting
 out of a woman's portion by the heir.

ASSIMILATE, Lat. *assimilo*, *assimila-*

ASSIMILATENESS, *tum*; from *ad*, and *similis*,

ASSIMILATION, to bring to the like, to

ASSIMILATIVE, make like, to liken, to

ASSIMILABLE, resemble, to convert to its
 own substance by digestion, and the process car-
 ried on in animal or vegetable bodies.

The spirits of many will find but naked habitations; meeting no *assimilables* wherein to re-act their natures. *Brown's Vulgar Errors.*

How little must the ordinary occupations of men seem to one who is engaged in so noble a pursuit as the *assimilation* of himself to the Deity. *Berkeley.*

Fast falls a fleecy show'r: the downy flakes

Descending, and with never ceasing lapse

Softly alighting upon all below,

Assimilate all objects. *Couper's Poems.*

A ruin is a sacred thing. Rooted for ages in the soil, *assimilated* to it, and become as it were a part of it, we consider it a work of nature, rather than of art. *Gilpin's Tour to the Lakes.*

ASSIMILATION, in physics, is that motion by which bodies convert other bodies related to them, or at least such as are prepared to be converted, into their own substance and nature. Thus flame multiplies itself upon oily bodies, and generates new flame; air upon water, and produces new air; and all the parts, as well similar as organisical, in vegetables and animals, first attract with some election or choice, nearly the same, common or not very different juices for aliment, and afterwards assimilate or convert them to their own nature.

ASSINIBONS, a native tribe of North Americans, whose name has been given to the western branch of the Great Red River. This stream divides itself into two branches, about thirty miles from its estuary in lake Winnipeg, the eastern branch bearing the name of the Red River from its source, the western, which rises in N. lat. $51^{\circ} 15'$, and W. long. $103^{\circ} 20'$, that of Assinibons. Extensive plains, covered with a short rank grass, and crowded with buffaloes and elks, extend between these streams, but timber even for firewood is scarce. The soil is gravelly, and beds of lime and stone form the rapids of these rivers; which are both navigable by canoes up to their source.

ASSINT, a parish of Scotland in the county of Sutherland, about fifteen miles in breadth, and twenty-five in length.

ASSIRATUM, in antiquity, a bloody draught, wherewith treaties were ratified. It was made of wine and blood, called by the ancient Romans assir.

ASSIS, in physiology, opium, or a powder made of hemp-seed, which being formed into boluses about the bigness of chestnuts, is swallowed by the Egyptians, who hereby become intoxicated and ecstatic. It is called by the Turks asserac.

ASSISA CADERE, in law; from assideo, to be nonsuited; when the complainant, from defect of legal evidence can proceed no further. Assisa cadit in juratum, is where a thing in controversy is so doubtful that it must necessarily be tried by a jury. Assisa continuanda, a writ directed to justices of assize for the continuation of a cause when certain records alleged cannot be produced in time by the party that has occasion to use them. Assisa proroganda, a writ for the stay of proceedings by reason of the parties being employed in the king's business. Assiza panis et cerevisia, assize of bread and beer, a statute for regulating their weight and quantity. Assisa Notumenti, see NUISANCE. Assisa capi in modum assisa, when the defendant pleads directly to the assize.—Assisa judicum, a judg-

ment of the court given either against the plaintiff or the defendant.

ASSISI, a small town in the papal dominions, in the duchy of Spoleto: the see of a bishop. St. Francis, the celebrated founder of the Franciscan order, was born here; and lies buried in the Sacro Convento. Near the foot of the hill on which the town stands is a rustic chapel, dedicated to the virgin and the angels, in which St. Francis is supposed to have received his first call to devotion. Over this a spacious church has been erected; and, on the second of August, multitudes of pilgrims flock to it from the adjoining provinces. When Mr. Eustace passed it in 1802, one of the fathers informed him, that more than 10,000 persons had attended the last anniversary, and that ten had been suffocated or trampled to death, in pressing forward to touch the altar. Here are the ruins of a temple of Minerva, built about the time of Augustus. The portico consisted of six fluted Corinthian columns, each having a distinct pedestal. It is now used as the portico of the church of Santa Maria di Minerva. In the neighbourhood of Assisi are other vestiges of Roman magnificence; ruins of baths, temples, and an aqueduct. The bishopric was dissolved by the French in 1810. Twenty miles N.N.W. of Spoleto. Long. 12° 30' E., Lat. 43° 3' N.

ASSISII, in ecclesiastical writers, persons beneficed in a cathedral church, not in a rank below that of canons; thus called, either because they were allowed an assisia or pension, or from assiduous, diligent.

ASSIST^t, *Assisto*; from *ad*, and *sisto*, to stop or stay. To place one's self by another so as to assist. give him our strength; to stand by, not in the sense of to look on, but to give support—to help.

The council of Trent commends recourse, not only to the prayers of the saints, but to their aid and assistance: what doth this aid and assistance signify?

Stillingfleet.

You have abundant assistances for this knowledge, in excellent books. *Wake's Prep. for Death.*

One bull, with curl'd black head beyond the rest,
And dew-laps hanging from his brawny chest,
With nodding front awhile did daring stand,
And with his jetty hoof spurn'd back the sand :
Then, leaping forth, he bellow'd out aloud :
Th' amazed assistants back each other crowd,
While monarch-like he rang'd the listed field ;
Some toss'd, some gor'd, some trampling down, he
kill'd. *Dryden. Conquest of Granada*, part i.

Let us entreat this necessary assistance, that by his grace he would lead us. *Rogers.*

Loose at each joint; each nerve with horror shakes,
Stupid he stares, and all assistless stands.
Such is the force of more than mortal hands.

Pope. Homer's Iliad, book xvi.

God assists us in the virtuous conflict, and will crown the conqueror with eternal rewards. *Blair.*

While my thoughts were thus employed, I was sent by Metopis towards the mountains of the desert Oasis, that I might assist his slaves in looking after his stocks, which were almost without number.

Hawkesworth's Telemachus.

Eternal God,

Guide thou my footsteps in the way of truth,
And oh ! assist me so to live on earth,
That I may die in peace, and claim a place
In thy high dwelling. *Kirke White's Poem.*

ASSISTANTS, in various trading or public companies, members who have the whole power of managing the company's affairs; and commonly called the court of assistants.

ASSISUS, in ancient law writers, a thing farmed out for a certain rent, in money or provisions.

ASSITHMENT; from *ad*, to, Lat. and *sithe*, Sax. instead of; a weregild, or compensation by a pecuniary mulct, *quod vita supplicii ad expiandum delictum solvitur.*

ASSIZE, *v. & n.* Fr. *assise*, part. past, from the verb *asseoir*, to sit. To sit judicially, or under the sanction or appointment of the law.

There was not a point truly
That it was in his right *assise*.

Chaucer. The Romaunt of the Rose, ch. i.

When in mid air the golden trump shall sound,

To raise the nations under ground ;

When in the valley of Jehosaphat

The judging God shall close the book of fate ;

And there the last *assizes* keep,

For those who wake, and those who sleep.

Dryden. Ode to the Memory of Mrs. A. Killigrew.

ASSIZE, in old English law books, is defined to be an assembly of knights, and other substantial men, together with a justice, in a certain place, and at a certain time; but the word, in its present acceptation, implies a court, place, or time, when and where the writs and processes, whether civil or criminal, are decided by judge and jury. All the counties of England were, very anciently, divided into six circuits, and two judges assigned by the king's commission, to hold their assizes twice a-year in every county, except London and Middlesex. They were afterwards directed by magna charta, c. 12, to be sent in every county once a-year to take or try certain actions then called recognitions or assizes; the most difficult of which they are directed to adjourn into the court of common pleas to be there determined. But the present justices of assize and nisi prius are more immediately derived from the statute Westm. 2. 13 Edw. I. c. 30. explained by several other acts, particularly the statute 14 Edw. III. c. 16. and must be two of the king's justices of the one bench or the other, or the chief baron of the exchequer, or the king's serjeants sworn. They usually make their circuits in the respective vacations after Hilary and Trinity terms; assizes being allowed to be taken in the holy time of Lent by consent of the bishops at the king's request, as expressed in statute Westm. 1. 3 Edw. I. c. 51. The judges upon the circuits now sit by virtue of five several authorities. 1. The commission of the peace in every county of the circuits; and all justices of the peace of the county are bound to be present at the assizes; and sheriffs are also to give their attendance on the judges, or they shall be fined. 2. A commission of oyer and terminer, directed to them and many other gentlemen of the county, by which they are empowered to try treasons, felonies, &c and this is the largest commission they have. 3. A commission of general gaol-delivery, directed to the judges and the clerk of assize associate, which gives them power to try every prisoner in the gaol committed for any offence whatsoever, but none except

prisoners in the gaol: so that one way or other they rid the gaol of all the prisoners in it. 4. A commission of assize, directed to the judges and clerk of assize, to take assizes; that is to take the verdict of a peculiar species of jury called an assize, and summoned for the trial of landed disputes: the other authority is, 5. That of nisi prius, which is a consequence of the commission of assize, being annexed to the office of those justices by the statute of Westm. 2. 13 Edw. I. c. 30. And it empowers them to try all questions of fact issuing out of the courts of Westminster, that are then ripe for trial by jury. Formerly, the judges could not act in counties where they resided or were born; but this custom is abrogated by 49 Geo. 3. c. 91.

ASSIZE, or jury, in Scots law, consists of fifteen sworn men, (juratores,) picked out by the court from a greater number, not exceeding forty-five, who have been summoned for that purpose by the sheriff, and given in a list to the defender, at serving him with a copy of his libel.

ASSIZER, or ASSISER, from assize; an officer that has the care and oversight of weights and measures in various parts of England.

ASSOCIATE, *v. n. & adj.* Lat. *ad socio,*

ASSOCIA'TION, { from *ad*, and *socio*,

ASSOCIA'TOR. { *socio*, from *sequor*, to follow. To meet together as ~~confidels~~, to keep in company, to be partners, confederates.

Their defender, and his *associate*, have sithence proposed to the world a form, such as themselves like.

Hooker.

The church, being a society, hath the self-same original grounds which other politick societies have; the natural inclination which all men have unto sociable life, and consent to some certain bond of association; which bond is the law that appointeth what kind of order they should be *associated* in. *Id.*

A fearful army, led by Caius Marcius,
Associated with Aufidius, rages

Upon our territories. *Shakespeare.*

Sole Eve, associate sole, to me (beyond
Compare) above all living creatures dear.

Milton.

Associate in your town a wand'ring train;
And strangers in your palace entertain. *Dryden.*

He was accompanied with a noble gentleman, no
unsuitable associate. *Wotton.*

They persuade the king, now in old age, to make
Plangus his *associate* in government with him.

Sidney.

Self-denial is a kind of holy association with God; and, by making you his partner, interests you in all his happiness. *Boyle.*

Association of ideas is of great importance, and may be of excellent use. *Watts.*

But my *associates* now my stay deplore,
Impatient. *Pope. Odyssey.*

ASSOCIATE PRESBYTERY, the title first assumed by those clergymen who associated together, after seceding from the church of Scotland, in 1733.

ASSOCIATE SYNOD, was the highest ecclesiastical court among the Antiburgher Seceders of Scotland. Its decisions being final, like those of the General Assembly. See Antiburgher and Seceders.

ASSOCIATION, in law, is a patent by the king, either of his own motion, or at the suit of a party plaintiff, to the justices of assize; to

have other persons *associated* with them, in order to take the assize.

ASSOCIATION OF IDEAS, is where two or more ideas constantly and immediately accompany or succeed one another in the mind, so that one shall almost infallibly produce the other, whether there be any natural relation between them or not. See METAPHYSICS. Wrong combinations of ideas, Mr. Locke shows, are a great cause of the irreconcileable opposition between different sects of philosophy and religion: for we cannot imagine, that all who hold tenets different from, and sometimes even contradictory to one another, should wilfully and knowingly impose upon themselves, or refuse truth offered by plain reason: but some loose and independent ideas are by education, custom, and the constant din of party, so coupled in their minds, that they always appear there together: these they can no more separate in their thoughts, than if they were but one idea; and they operate as if they were so. This gives the appearance of sense to jargon, of demonstration to absurdities, and of consistency to nonsense. It is the foundation of the greatest, and almost of all the errors in the world. Association forms a principal part of Dr. Hartley's mechanical theory of the mind. He distinguishes it into synchronous and successive; and ascribes our simple and complex ideas to the influence of this principle or habit. Particular sensations result from previous vibrations conveyed through the nerves to the medullary substance of the brain; and these are so intimately associated together, that any one of them, when impressed alone, shall be able to excite in the mind the ideas of all the rest. Thus we derive the ideas of natural bodies from the association of the several sensible qualities with the names that express them, and with each other. The sight of part of a large building suggests the idea of the rest instantaneously, by a synchronous association of the parts; and the sound of the words, which begin a similar sentence, brings to remembrance the remaining parts, in order, by successive association. Dr. Hartley maintains, that simple ideas run into complex ones by association; and apprehends, that, by pursuing and perfecting this doctrine, we may some time or other be enabled to analyse those complex ideas, that are commonly called the ideas of reflection, or intellectual ideas, into their several component parts, i. e. into the simple ideas of sensation of which they consist; and that this may be of considerable use in the art of logic, and in explaining the various phenomena of the human mind.

ASSODES, in medicine, a continued fever,

wherein the surface is moderately warm, but the

internal heat great.

ASSOIL', { Supposed to be from the
ASSOI'LMENT. { Fr. *absoudre*; Lat. *absolvere*,

to loose or free from. To absolve from guilt; to liberate from punishment; to pardon, to forgive.

This is my drede, and ye, my brethren tweie,
Aswileth me this question I preie.

Chaucer. The Merchantes Tale.

But secretly *assuiling* of his sin,
No other med'cine will unto him lay.

Mirror for Magistrates.

I also wyll aske of you a certayne questio:, whiche
yf ye assayle me, I in lykewyse wyll tell you by what
auctorite & do these thynges.

Bible, 1551. Matthew ch. xxi.

But with such guilefull appendices of oathes im-
posed on him, that this *assulement* was not so much
the epilogue of his olde, as the prologue of his new
tragicall vexations.

Speed's *History of Great Britaine*.

To *Assoile*, in our ancient law books, sig-
nifies to absolve from an excommunication.

ASSONANCE, in rhetoric and poetry, a term
used where the words of a phrase or verse have
the same sound or termination, and yet make no
proper rhyme. These are usually accounted
vicious in English; though the Romans some-
times used them with elegance: as, *Militem
comparavit, exercitum ordinavat, aciem lus-
travit.*

ASSORT', } Fr. *assortir*, from the Lat.

ASSORT'MENT. } *sors*, lot. To sort, to put
things of the same kind or class together, to
match, to suit.

Ye ne be but fools of good dispert!

I wole you teache a new play;

Sit down here by one *assort*,

And better mirth never ye seigh.

Sir Ferumbras, in Ellis, v. ii. p. 401.

A taylor sat musically at it in a shed over against
the convent, in *assorting* four dozen of bells for the
harness, whistling to each bell as he tied it on with a
thong.

Sterne's *Tristram Shandy*.

An adjective is by nature a general, and in some
measure an abstract word, and necessarily presupposes
the idea of a certain species or assortment of things,
to all of which it is equally applicable.

Smith's *Moral Sentiments*.

ASSOS, a sea-port of Natolia, subject to the
Turks, on a bay of the Ægean Sea, twelve miles
south-east of Troas.

ASSRUMINA, in botany, the name given by
the people of Guinea to the shrub whose leaves
they use as a cure for long worms, which are
found in their flesh: they bruise the leaves, and
apply a large lump of the mass to the part.

ASSU'AGE, } Old Fr. *assouager*. The
ASSU'GMENT, } modern Fr. is *soulager*. To
ASSU'A'SIVE. } soften, to alleviate pain or
grief, to lessen, to allay, to render tranquil.

Tell me, when shall these weary woes have end;
Or shall their ruthless torment never cease,
But all my days in pining languor spend,
Without hope of *assuagement* or release?

Spenser's *Sonnets*.

Shall I, t' *assauge*
Their brutal rage,
The regal stem destroy? *

Dryden's *Albion*.

The rest

Was broiled and roasted for the future feast,
The chief invited guests were set around;
And, hunger first *asswag'd*, the bowls were crown'd,
Which in deep draughts their cares and labours
drown'd.

Id. *Fables*.

If in the breast tumultuous joys arise,
Musick her soft *assuasive* voice supplies.

Pope's *St. Cecilia*.

Refreshing winds the summer's heats *assuage*;
And kindly warmth disarms the winter's rage.

Addison.

Patroclus sat contentedly beside
Euryalus, with many a pleasant theme,
Soothing the generous warrior, and his wound
Sprinkling with drugs *assuasive* of his pains.

Couper's *Iliad*, bk. xv. p. 274.

ASSUEFACTION, } *Assuefacio*, *assuface-*
ASSUETUDE. } *tum*, to accustom. The
state of being accustomed.

We see that *assuetude* of things hurtful, doth make
them lose the force to hurt.

Bacon's *Natural History*.

Right and left, as parts inservient unto the motive
faculty, are differenced by degrees from use and *assue-*
faction, or according whereto the one grows stronger.

Brown's *Vulgar Errors*.

ASSUME', } *Assumo*, *assumptum*, *ad*
ASSU'MER, } and *sumo*, to take to [one's
ASSU'MING, } self.] To appropriate, to
ASSUMPT', *v. & n.* } claim more than is due, to
ASSUMPTION. } arrogant, to suppose some-
thing granted without proof.

Preserve the right of thy place, but stir not ques-
tions of jurisdiction; and rather *assume* thy right in
silence, and de facto, than voice it with claims and
challenges.

Lord Bacon's *Essays*.

His majesty might well *assume* the complaint and
expression of king David.

Clarendon.

With ravish'd ears

The monarch hears;

assumes the god,

Affects to nod;

And seems to shake the spheres. Dryden.

His haughty looks, and his *assuming* air,

Id.

The son of Isis could no longer bear.

Id.

This makes him over-forward in business, *assuming*
in conversation, and peremptory in answers. Collier.

For spirits freed from mortal laws, with ease

Assume what sexes and what shapes they please.

Pope.

This, when the various god had urg'd in vain,

Id.

He strait *assum'd* his native form again.

Id.

The personal descent of God himself, and his *as-*
suming of our flesh to his divinity, more familiarly
to insinuate his pleasure to us, was an enforcement
beyond all methods of wisdom.

Hammond's *Fundamentals*.

In every hypothesis something is allowed to be
assumed.

Bugle.

Upon the feast of the *assumption* of the Blessed
Virgin, the pope and cardinals keep the vespers.

Stillingfleet.

Adam, after a certain period of years, would have
been rewarded with an *assumption* to eternal felicity.

Wake.

It is scarce possible to conceive any scene so truly
agreeable, as an assembly of people elaborately educated,
who *assume* a character superior to ordinary
life, and support it with ease and familiarity. Usher.

It very seldom happens that a man is slow enough
in *assuming* the character of a husband, or a woman
quick enough in condescending to that of a wife.

Steele.

Habits are soon *assumed*, but when we strive
To strip them off, 'tis being flayed alive. Couper.

ASSU'MENT. *Assuo*, to stitch or tack on.

A tacking on.

This *assument* or addition, Dr. Marshall says, he
never could find any where but in this Anglo-Saxon
translation, and that very ancient Greek and Latin
MS copy of Beza's.

Lewis's *Editions of the Eng. Trans. of the Bible*.

ASSUMPSIT, in the law of England, or
promise, is of the nature of a verbal covenant,
and wants nothing but the solemnity of writing

and sealing to make it absolutely the same. If therefore, it be to do any explicit act, it is an express contract, as much as any covenant: and the breach of it is an equal injury. The remedy indeed is not exactly the same: since, instead of an action of covenant, there only lies an action upon the case, for what is called an assumpsit or undertaking of the defendant; the failure of performing which, is the wrong or injury done to the plaintiff, the damages whereof a jury are to estimate and settle. As, if a builder promises or undertakes, that he will build and cover a house within a limited time, and fails to do it, an action on the case arises against the builder, and the party injured may recover a pecuniary satisfaction. But some agreements, though ever so expressly made, are deemed of so important a nature, that they ought not to rest on a verbal promise only, which cannot be proved but by the memory of witnesses, and which oftentimes leads to perjury. To prevent this, the statute of frauds and perjuries, 29 Car. II. c. 3. enacts, that in the five following cases, no verbal promise shall be sufficient to ground an action upon; but at the least some note or memorandum of it shall be made in writing, and signed by the party to be charged therewith: 1. Where an ~~executor~~ or administrator promises to answer damages out of his own estate. 2. Where a man undertakes to answer for the debt, default, or miscarriage, of another. 3. Where any agreement is made upon consideration of marriage. 4. Where any contract or sale is made of lands, tenements, or hereditaments, or any interest therein. 5. And lastly, where there is any agreement that is not to be performed within a year from the making thereof. In all these cases, a mere verbal assumpsit is void.

ASSUMPTION, a festival in the Romish church, in honor of the miraculous ascent of the Virgin Mary into heaven: the Greek church, who also observe this festival, celebrate it on the 15th of August with great ceremony.

ASSUMPTION, or ASSONGONG, one of the Ladrones islands, in the Pacific Ocean. Father Gobien asserts that it is eighteen miles in circumference; but Perouse diminishes its size to three. It is of a conical figure, rising 600 feet in height, of dreary aspect, and almost covered with lava from the eruptions of a volcano in the centre. A few cocoa-nut trees are found on the island; but there is no anchorage near the shore. Fifteen miles south of St. Lawrence. Long. 140° 55' E., lat. 19° 45' N.

ASSUMPTION, the capital city of Paraguay, in America. It is situated on the eastern bank of the river Paraguay, eighteen miles above its junction with the first mouth of the Pilcomayo. It was originally a small fort, built in 1538, and in 1547 was erected into a bishopric. It is now inhabited by about 500 families of Spaniards, and several thousand Indians and Metzicos.

ASSUMPTIVE ARMS, in heraldry, are such as a person has a right to assume, with the approbation of his sovereign, and of the heralds: thus, if a person, who has no right by blood,

and has no coat of arms, shall captivate, in any lawful war, any gentleman, nobleman, or prince, he is, in that case, entitled to bear the shield of that prisoner, and enjoy it to him and his heirs for ever.

ASSURE',
ASSUR'ED,
ASSUR'ANCE,
ASSUR'EDLY,
ASSUR'EDNESS.

Fr. *assurer*, to make sure.
To secure, to assert, aver,
warrant, vouch, certify, inspire with confidence.

What man is he that boasts of fleshly might,
And vain assurance of mortality;
Which all so soon, as it doth come to fight
Against spiritual foes, yields by and by.

Faerie Queene.

I must confess, your offer is the best;
And, let your father make her the *assurance*,
She is your own, else you must pardon me;
If you should die before him, where's her dower?

Shakespeare.

I hold the entry of common-places to be a matter of great use and essence in studying, as that which assuredly copiousness of invention, and contracteth judgment to a strength.

Bacon's Essays.

An *assurance*, being passed through for a competent fine, hath come back again by reason of some oversight.

Id.

I revive
At this last sight; *assur'd*, that man shall live
With all the creatures, and their seed preserve.

Milton

Well is that part of us lost which may give assurance of the salvation of the whole.

Hall's Contemplations.

Assuredly he will stop our liberty, till we restore him his worship.

South.

It is the ennobling office of the understanding to correct the fallacious and mistaken reports of the senses, and to assure us that the staff in the water is straight though our eye would tell us it is crooked.

Id.

The obedient, and the man of practice, shall out-grow all their doubts and ignorances; till persuasion pass into knowledge, and knowledge advance into assurance.

Id.

Hath he found in an evil course that comfortable assurance of God's favour, and good hopes of his future condition, which a religious life would have given him?

Tillotson.

ALMANZ. No; there is a necessity in fate;
Why still the brave bold man is fortunate,
He keeps his object ever full in sight,
And that assurance holds him firm and right.

Dryden. Conquest of Granada, part i.

A man without assurance is liable to be made uneasy by the folly or ill-nature of every one he converses with.

* *Melmoth's Translation of Cicero's Laius*

How happy it is to believe with a stedfast assurance that our petitions are heard even while we are making them, and how delightful to meet with a proof of it in the effectual and actual grant of them.

Cowper's Letters.

The soul reposing on assured relief,
Feels herself happy amidst all her grief;
Forgets her labour, as she toils along,
Weeps tears of joy, and bursts into a song.

Couper.

A S S U R A N C E.

ASSURANCE, or INSURANCE, in commercial affairs. Under the latter word, every thing connected with the subjects, both of life and of marine insurance, might with great propriety be arranged. But mercantile usage, and the titles of various respectable societies in this country, have appropriated the former word to contracts for paying sums of money upon the continuance of life, or in the event of death; and the latter, to the insurance of property against the contingencies of the sea. We propose, under LIFE ANNUITIES, to enter further into the principles on which the contingency of life is calculated; under MARINE INSURANCE, to treat of all that is usually comprised under that head; confining ourselves in this paper to the practical detail of the methods adopted by the most respectable Assurance companies in the conduct of their affairs, and the actual calculations on which they proceed.

Assurance on lives is the guaranteeing a certain sum of money to be paid in the event of a person named being alive at a certain time, or dying within a certain time, or to be paid within a certain time after the death of a person named. The party agreeing to pay this sum, is termed the Assurer; the sum he receives for his hazard, or in compensation for what he is to pay, is called the Premium of assurance; and the instrument by which the parties are mutually bound to their contract, is called a Policy of assurance. These are granted sometimes by individuals; but in this case the policies, though often for larger sums than the companies insure, are usually for short periods, and at higher rates than the companies charge. It must be obvious, that as they are particular bargains between individuals under circumstances known, particularly, perhaps, or that ought to be known by those concerned, no uniform plan of proceeding can be expected.

But the respectable societies who conduct this business in the metropolis, and other parts of Great Britain, proceed upon settled and mathematical principles. Tables of the ordinary duration of human life, formed from bills of mortality, are the basis of their calculations. The register of mortality at Northampton, originally published by Dr. Price, is that generally adopted; it having been found by long experience that rather fewer deaths happen, according to the books of the Equitable Assurance Society, than are upon that scale to be expected. The most esteemed tables are those of Aikin, De Parioux, Kersboom, and Gorsuch. M. de Moivre assumes, that if eighty-six persons were born at the same time, one would die in each year, until the whole number ceased to live. Although this hypothesis has not been found accurate enough for extensive business in this way, it furnishes an easy rate for estimating the expectation of life. Subtract the given age of a person from 86; when, dividing the quotient by two, the remainder gives the expectation nearly. Thus, let the

age be 40, then $\frac{86-40}{2}$ is 23, which differs very

little from the Northampton table. At the age of 50 again, the error is trifling, the Northampton table giving 17.99, De Moivre's, 18. But, in the higher ages, the error becomes considerable.

A scale of life having been adopted, the table of premiums to be paid by the parties insuring is calculated in the following manner:—The premium for a certain age being supposed to be known, then the premium for a person of one year younger, being compounded of the premium for one year and the present value of the above premium, is easily calculated from the table of lives, thus:—Multiply the premium on the oldest life into the number of persons alive in the tables of that age, and divide by the number of persons of the younger age alive in the tables. This sum, discounted for a year, gives the premium for assuring the desired sum at the end of the year. Then multiply the sum to be assured into the number of persons of the younger age, that die according to the tables in a year, and divide by the number of persons alive at that age, and this sum discounted for a year is the assurance of the sum for the first year, and consequently the two sums, added together, give the desired premium. Now, as the oldest person in the scale of life dies in the ensuing year, the premium on him is evidently the sum to be paid discounted for one year, and thence the premium for the age below is ascertained by the above rule; and so of every age in succession. Errors cannot be committed on this plan without detection, as every step is checked by a similar table drawn out for the value of an annuity at each age. In the same manner are tables formed for the assurance of a sum payable at the death of one out of two persons, or at the death of the survivor of two persons, or at the death of one on the contingency of his surviving another, and so on. The tables generally adopted by the companies, on the contingency of one person surviving another, being calculated by an approximation, founded on the expectation of their lives, do not partake of the mathematical accuracy of the other tables; but the companies, in this case, grant assurances at times to their own disadvantage; for if they take rather too much upon one life, they lose that sum upon the other; the premium payable on the death of one of two parties, being divided by the above-mentioned rule of approximation into two premiums, to be paid by the two parties on the contingency of one surviving the other. These rules apply to tables of rates for the payment of a gross premium: but as it is generally more convenient to pay an equivalent annual sum, a table of rates is made for this case, which is formed by dividing the gross premium by the value of an annuity upon each age added to unity. If the annual premium were paid at the end of the year, the addition of unity would be unnecessary; but a policy is not granted till one premium is paid, and hence the necessity of the addition is obvious.

Premiums being thus settled from a fixed table of observations on life, it is evident that, unless

the deaths happen exactly in the order prescribed by the tables, there will be a surplus or deficiency of capital for the payment of the assured sums. The management of the surplus, or apprehended surplus, which the prudence of respectable companies generally insures, is different in different companies. Either the company appropriates the whole of the surplus to itself, or makes a compensation to the assured for it. In the former case, the company pays the sum specified in the policy, and no more; consequently, a party may pay to the office a sum far greater than his executors or assigns receive in return. Thus, if an assurance is effected on a person between sixteen and seventeen for £100, receivable at his death, the annual premium is £2. 0s. 8d.; and if he lives forty-nine years, he will have paid more than the whole sum to be received, without computing interest on these payments. The surplus of the accumulation of premiums above the claims may be great from two causes: first, the increased interest obtained by the company above that by which the table of rates was computed; and, second, a longer duration of life in the earlier years than is assigned by the table; and here great circumspection on the part of the company is requisite to preserve it from ~~its~~ position, and to secure the best lives that circumstances admit. In the companies where only the sum specified in the policy is paid, the surplus does not go entirely to the company; for it is common in these offices to allow a per centage on the premium to the party who brings an assurance to them, generally a solicitor, who thus participating in the gains of the company, has an interest in increasing its concerns, though to the evident disadvantage of his client.

Where the surplus is made advantageous to the assured, two methods are adopted; the one is to add, at certain periods, a sum to each policy; the other to diminish the premium. In both cases a valuation is made of all the annual premiums, with the past and future expected accumulations, and also of the claims upon every policy. If the former exceed the latter to a sufficient amount, then an addition is made to each policy, or the premium is diminished. It is necessary, however, that the utmost care should be taken to secure to each policy the sum named in it, with every addition made to it; and hence a third part of the surplus is constantly retained to guard against possible contingencies. This reservation has occasioned a singular anomaly in one of the most distinguished companies for life assurance. In that company all are partners, being mutually guarantees to each other for the payment of their respective claims. The surplus arising from the excess of premiums, with their accumulations above the claims, evidently belongs to the whole company, and consequently each partner is entitled to a portion of it. But of this surplus, a third being constantly reserved, and each person at his death ceasing to be a partner, every person leaves behind him a portion for his successors. Such has been the extreme caution of the Equitable Society.

This led to the formation of a plan, which is

adopted by the Rock Assurance Society, that vests this third in determinate hands. To do this, the company consists of a number of proprietors, each of whom is bound to keep up an assurance with it, and whose interest in these assurances is greater than that derived from the profit of assurances granted to non-proprietors. The company takes upon itself the whole risk of policies made with it, being bound to pay to each party assured the sum specified in his policy; and additions are made to each policy in the manner above-mentioned. But the third reserved is joined to, and makes part of the subscription capital stock; and the interest upon it is annually divided among the proprietors. Thus the third reserved belongs to, and continues to add to, the security of the company; and the non-proprietor, secured from all risk, participates in the two-thirds divisible at every period.

Other modes are sometimes adopted to dispose of accumulating property; such as, by diminishing, at certain periods, the premiums paid on assurance; in this case the sum specified in the policy is paid, though the party assured may have paid a much less sum than in the companies above mentioned. The diminution of premium depends on the excess of capital in hand, with the present value of future premiums, above the claims that are or may be made upon it, and consequently the same care is necessary to reserve a part of the surplus for fear of future contingencies. The public have thus a choice either to receive a fixed or an increasing sum; the fixed sum by means of a definite or a probably decreasing premium, and an increasing sum by means of a definite premium.

Assurance policies are generally confined to the limits of Europe, but they are capable of being extended to all parts of the world. In such cases an addition is made to the premium, according to the supposed addition to the risk from unhealthiness of climate, and danger of the seas. Additions are also made to the premium on account of the profession (as of the army) of the assured; on account of disease, as of gout, by which he is occasionally afflicted; or of diseases, as of small-pox and measles, to which he may be liable.

The oldest of the societies for assurances on lives in London, is the Amicable Society, instituted by charter in the year 1706. The same contribution was originally required from every member, whatever his age might be, and the sums received at the death of members were variable, depending on the number of persons that died in the same year. Subsequent alterations were made in this company by successive charters. At present the several interests of the members are divided into shares, each share being now warranted to produce £200 at the death of the insured, together with such additions as may arise from the circumstances of the year in which the death happens; and any number of shares, and half shares, not exceeding sixty-five shares, may be granted on one and the same life, by which assurances may be effected from £200 to £5000, and participate in the benefits of the society.

The Royal Exchange Assurance Company re-

ceived its charter in 1720, and is principally engaged in insuring ships and goods at sea, and of houses and goods from fire; but it also grants annuities and assurances on life. In the latter, it confines itself to the payment of the sum assured.

The Equitable is the most considerable in point of numbers, and, on the whole, perhaps the most respectable of the societies for the assurance of lives, to which it is chiefly confined. In this society all are partners, and mutually assurers of each other. It arose from small beginnings, and has made considerable alterations from the rate of its first premiums, till it settled in the table annexed to this article, which is that generally adopted by these associations. At certain periods additions have been made to the policies; and, in this manner, its affairs were conducted till December 7, 1809, when a change took place respecting the members then assured, namely, that instead of waiting till the end of the next interval, for assigning a sum out of the accumulations to each policy, every member should have two per cent. annually assigned to his policy, during the years of this period. Consequently, all holders of policies, prior to the year 1810, will leave to their heirs the sum assured by the policy, together with its accumulations up to the year 1810, and also two per cent. per annum for his life, within 1810 and 1820; but this benefit does not accrue to members entering at the close of the year 1809. Whether this plan can be continued or extended, time will show. The number of the members in this society made it necessary to change some of their regulations respecting votes; and it was wisely resolved, that persons becoming members, after the 19th December 1809, should not have a vote at the general meetings, unless they had been assured for five years, for the whole continuance of life, in the sum of £2000; and to be a director, the qualification is an assurance of £5000 for the same time, which must have been held for five years.

The history of this society is very important, and has been well treated by Dr. Price, in his Observations on Reversionary Payments, and by Mr. Morgan. In consequence of the connexion of Dr. Price with this institution, he drew up his remarks on the various societies which soon after sprung up, and whose names, but for his notice of them, would now be forgotten. They were formed chiefly about the years 1770 and 1771, offering very fallacious terms to the public, by which the aged were benefited at the expense of their juniors; and the evil is not yet cured.

For some time no other important society arose; but, in the year 1792, the Westminster Life Assurance was formed. The Pelican in 1797; the Globe in 1799; the Albion in 1805; the Rock and the Provident in 1806; the Eagle, Hope, London Life Association, and Atlas, in 1807. The Rock and Equitable we have noticed.

The Provident combines with life, policies on fire; but it assigns also, at certain times, additions to its policies. The Hope is also a fire and life office, and both are proprietary companies.

The rates in these societies are the same as those in the Equitable and Rock.

The Albion and the Globe are life and fire assurance companies; their rates are also the same. They pay also the sum assured; but a liberal commission is allowed to solicitors, and to others who effect assurances.

The London Life Association is confined entirely to life assurances; but it differs from the others in this, that its aim is, that the benefits resulting from its transactions shall be enjoyed by the members during life; in other words, the society assures to a person the sum named in the policy, and no more; but at certain times it considers whether the surplus of the accumulations above the claims is sufficient to admit of a diminution of premium, and one is made accordingly. In this society all are members and assurers one of the other, and consequently the surviving members at any time are bound to make up the deficiency, if any should arise by this mode of arrangement. This could be done by raising, in the first instance, the premiums that have been lowered; and it is very improbable, that, with good management, any thing farther would be necessary. In imitation of these London Companies, several have been formed throughout the country.

The practical mode of effecting an assurance in these societies is as follows: The party desirous of effecting an assurance, receives from the office of the company a printed paper called a declaration, which he fills up with the name of the party to be assured, his age, the place and time of his birth, and place of his present residence, with certain particulars as to his health. This declaration is then duly signed; and it contains a clause, stating, that any falsehood in the declaration invalidates the policy. To corroborate the statement, references are given to two persons well acquainted with the party on whom the assurance is made, one of whom is to be a medical person, and sometimes more references are required. The reasons for these precautions are obvious.

When the declaration has been thus completed, the person by whom the assurance is made makes his appearance before the directors of the company, who enquire into the general state of his health, and a minute is entered in their books accordingly. The letter of the referees, with the declaration, are subsequently laid before the court, which from these documents, and information frequently derived from other sources, forms its decision; and this is entered on the minutes of the court, and communicated to the applicant. A certain time is allowed for the payment of the premium; and if it is not paid within that time, the assurance cannot be effected, but by a fresh application to the court, according to the forms above mentioned. On the payment of the premium a receipt is given, containing the number of the policy, which is then made out according to the declaration, inspected by the court, signed by a certain number of directors, and delivered to the other party interested in it.

If the person, on whose life the assurance is made cannot appear before the directors, or any

one appointed by them for that purpose, an additional sum is charged for non-appearance. There is also a duty to be paid to government on each policy, and this, with a small entrance fee, makes an addition to the first year's premium. But the premium itself is only named in the policy, as on the future payment of this sum its existence depends.

A policy is assignable; and it often forms a security for sums advanced, and not unfrequently becomes an object of sale. In these cases, the holder of the policy pays the future premiums, and the advantage of a purchaser consists in holding a policy at a less premium than he must have paid at the present age of the party, on whose life the assurance was made. Thus, supposing a policy to have been granted for the payment of a thousand pounds, at the death of a party aged between thirty-seven and thirty-eight, when the policy was made; suppose it is sold when the party is between fifty and fifty-one; the purchaser will have to pay £32. 5s. annually, during the existence of the policy: whereas, if he had taken out a policy at the present age of the party, his premium would be £46. 15s. For the difference between these two sums, namely £14. 10s., a price is fixed on; but it is to be observed, that, in the sale of a policy in the market, this disadvantage attends it,—that the bidders, not being acquainted with the person on whose life the policy is made, and being liable to trouble and expense, to ascertain that he is alive at each payment of the premium, must make a deduction on this account, from what they might otherwise presume to be a compensation for the difference between the two premiums.

On the death of the party on whom the claim depends, certain documents are required, such as the register of the burial of the deceased; and references to the medical persons or others who attended him in his last illness; and, if he effected the policy himself, the probate of his will, or, if it has been assigned to another, the copy of the assignment. The grounds of these precautions are, with respect to the receiver of the sum assured, obvious; and the nature of the death must be ascertained; as, in case of suicide, or dying by the hands of justice, or on a voyage on the high seas, without licence from the company, (except, in general, in going from one part in the united kingdom to another,) the policy is vitiated. In the interval between the notice of the party's death, and the time assigned for the payment of the claim, due investigation is made; and, every thing having been found satisfactory, the claimant brings with him the policy and a receipt for the sum claimed, which is immediately paid to him; the seals are torn from the policy, and the contract is at an end. In the

case that a claim is payable, in the event of a person being alive at a certain time, his appearance before the court is requisite, or sufficient proof must be given that he was alive at the time defined by the policy.

Policies depending on a person being alive at a certain time, are very rare, and chiefly confined to endowments for children, in which case the payment of a gross sum down, or of an annual payment till the child attains the age of twenty-one, secures to that child, at that age, the sum named in the policy. This mode of assurance has led some offices to compose a table of rates, according to which, a person at the age of twenty is required to pay a premium, which would produce at legal interest more than he would receive at the expiration of the year, from the company; and thus a person, if any such could be found, to effect an assurance of this kind, would run the risk of losing the sum assured, and receive, if successful, not so much as he could have attained without any risk at all.

On the whole, the doctrine of assurance must always be considered a subject of the first importance, in a commercial state like that of Great Britain, and to involve an immense number of interests. When we consider the thousands of families in this country, who are living in a state of comparative affluence, without possessing any, or very little, disposable property; whose income, in fact, depends almost entirely on the exertions of the head of the family, and with the extinction of whose life every source of income ceases; when we contemplate the poverty and distress in which many widows, with their helpless children, would be plunged by such an event, we cannot estimate too highly the advantages which are held out by those societies, who, on honorable principles, furnish the means whereby every provident father and husband may, in part, avert the consequences of a premature death; to which every one is liable, and against which event every man ought to be provided. Perhaps, no part of the civil economy of this country shows more decidedly the high moral state of the middling classes of the people, than the immense amount of life assurances effected in the different offices of the metropolis, and in those of like local companies in several of the counties in England; nor, perhaps, can we have a stronger instance of the high degree of confidence that the people are disposed to place in the moral rectitude of the government: by far the greater part of the capital of the companies to which we have alluded being invested under government securities.

The following is a table of the rates generally acted upon by the Life Assurance Offices in the capital.

ASSURANCE OF SINGLE LIVES.						SURVIVORSHIP OF A LIFE ASSURED.						ASSURANCE ON TWO JOINT LIVES.					
Age.	To secure a Sum to the Nominee, or to the lawful Representatives of the Assured.			To secure a Sum to the Nominee, or lawful Representatives of the Assured, in case a Person named shall survive another.			To secure a Sum, payable when either of Two Persons named shall happen to die.										
	Premium per cent. if assured from year to year.	Premium per cent. per an. if assured for seven years.	Premium per cent. per an. if assured for the whole term of life.	Age of the life assured.	Age of the life against which the assured is made.	Premium per cent. per annum.	Age.	Age.	Premium per cent. per annum.	Age.	Age.	Premium per cent. per annum.					
	£. s. d.	£. s. d.	£. s. d.	10	10	£. s. d.			£. s. d.			-					
8 to 14	0 17	9 1	5 1 17 7		20	1 8 6			10	10 2 17 1	30	30 4 8 11

ASSURGENT LEAVES, in botany, denote such as are first bent down, and then rise erect towards the apex.

ASSUS, or Assos, in ancient geography, a town of *Troas*, though by others supposed to be of Mysia, and the same with Apollonia, but different from the Apollonia on the Rhindacus. Ptolemy places it on the sea coast, but Strabo more inland. It was the country of Cleanthes, the stoic philosopher, who succeeded Zeno. St. Luke and others of St. Paul's companions in his voyage, Acts xx. 13, 14, went by sea from Troas to Assos: but St. Paul went thither by land; and, meeting them at Assos, they all went together to Mitilene.

ASSYRIA, an ancient kingdom of Asia, concerning the extent, commencement, and duration of which, historians differ greatly in their accounts. Several ancient writers, in particular Ctesias and Diodorus Siculus, have affirmed that the Assyrian monarchy, under Ninus and Semiramis, comprehended the greater part of the known world. Had this been the case, it is not likely that Homer and Herodotus would have omitted a fact so remarkable. The sacred records intimate that none of the ancient states or kingdoms were of considerable extent; for neither Chedorlaomer nor any of the neighbouring princes were tributary or subject to Assyria; and we find nothing of the greatness or power of this kingdom in the history of the judges and succeeding kings of Israel, though the latter kingdom was oppressed and enslaved by many different powers in that period. It is highly probable, therefore, that Assyria was originally of small extent. According to Ptolemy, it was bounded on the north by Armenia major; on the west by the Tigris; on the south by Susiana; and on the east by Media.

The revolutions of the Assyrian monarchy were numerous. Its founder was Ashur, the second son of Shem, who went out of Shinar, either by the appointment of Nimrod, or to elude the fury of that tyrant; conducted a large body of adventurers into Assyria, and laid the foundation of Nineveh, Gen. x. 11. These events happened not long after Nimrod had established the Chaldean monarchy, and fixed his residence at Babylon. The Persian historians suppose, that the kings of Persia of the first dynasty were the same with the kings of Assyria, of whom Zohath, or Nimrod, was the founder of Babel. Herbelot Orient. Bib. v. Bagdad. It does not, however, appear, that Nimrod reigned in Assyria. The kingdoms of Babylon and Assyria were originally distinct and separate, Micah v. 6; and in this state they remained until Ninus conquered Babylon, and made it tributary to the Assyrian empire. Ninus, the successor of Ashur, Gen. x. 11, Diod. Sic. lib. 1, seized on Chaldea, after the death of Nimrod, and united the kingdoms of Assyria and Babylon. This prince is said to have subdued Asia, Persia, Media, Egypt, &c. If he did so, the effects of his conquests were of short duration; for in the days of Abraham we do not find that any of the neighbouring kingdoms were subject to Assyria. He was succeeded by Semiramis, a princess of an heroic mind; bold, enterprising, fortunate; but of whom many fabulous things have been recorded. It appears, however, that there were two

princesses of the same name, who flourished at very different periods. One of them was the consort of Ninus; and the other lived five generations before Nitocris, queen of Nebuchadnezzar, Euseb. Chron. p. 58. Herod. lib. 1, cap. 184. This fact has not been attended to by many writers. Whether there was an uninterrupted series of kings from Ninus to Sardanapalus, or not, is still a question. Some suspicion has arisen, that the list which Ctesias has given of the Assyrian kings is not genuine; for many names in it are of Persian, Egyptian, and Grecian extraction. Nothing memorable has been recorded concerning the successors of Ninus and Semiramis. Of that effeminate race of princes it is barely said, that they ascended the throne, lived in indolence, and died in their palaces at Nineveh. Diodorus relates, that in the reign of Teutames, the Assyrians solicited by Priam their vassal, sent to the Trojans a supply of 20,000 foot and 200 chariots, under the command of Memnon, son of Tithonus, president of Persia. But this is not confirmed by any other author. Sardanapalus was the last, and by all accounts the most effeminate of the ancient Assyrian kings. Historians have unanimously reprobated his character; and Lord Byron has made it the foundation of a beautiful poem. We have only to add, that Arbaces, governor of Media, taking advantage of Sardanapalus's indolence, withdrew his allegiance and rebelled against him. He was encouraged in this revolt by the advice and assistance of Belesis, a Chaldean priest, who engaged the Babylonians to follow the example of the Medes. These powerful provinces, aided by the Persians and other allies, who despised the effeminacy, or dreaded the tyranny of their Assyrian lords, attacked the empire on all sides. Their most vigorous efforts were, in the beginning, unsuccessful. Firm and determined, however, in their opposition, they at length prevailed; defeated the Assyrian army, besieged Sardanapalus in his capital, which they demolished, and became masters of the empire A. A. C. 621. The Assyrian empire was now divided into three kingdoms, viz. the Median, Assyrian, and Babylonian. Arbaces retained the supreme power and authority, and fixed his residence at Ecbatana in Media. He nominated governors in Assyria and Babylon, who were honored with the title of kings, while they remained subject and tributary to the Median monarchs. Belesis received the government of Babylon as the reward of his services; and Phul was entrusted with that of Assyria. The Assyrian governor gradually enlarged the boundaries of his kingdom, and was succeeded by Tiglath-pileser, Salmanasar, and Sennacherib, who asserted and maintained their independency. After the death of Esar-haddon, the brother and successor of Sennacherib, the kingdom of Assyria was split, and annexed to the kingdoms of Media and Babylon. Several tributary princes afterwards reigned in Nineveh; but no particular account of them is found in the annals of ancient nations. We hear no more of the kings of Assyria, but of those of Babylon. Cyaxares, king of Media, assisted Nebuchadnezzar, king of Babylon, in the siege of Nineveh, which they took and destroyed, A. A. C. 606.

The most remarkable provinces of Assyria

were, 1. Arapachitis, bordering on Armenia. 2. Corduene, a mountainous territory, the ancient residence of the Carduchi, mentioned by Xenophon in his Anabasis. 3. Adiabene, in Strabo's time, the most considerable province in Assyria. 4. Calachene, lying between the mountains of Armenia and Zabus Major. 5. Apolloniatis, watered by the river Gorgus. 6. Settagene, by some reckoned a portion of Babylonia. 7. Chaloniatis, separated from Media by a branch of Mount Taurus.

ASSYRIAN LETTERS, a denomination given by several Rabbins and Talmudists, to the characters of the present Hebrew alphabet, as supposing them to have been borrowed from the Assyrians during the Jewish captivity in Babylon.

ASTA, an inland town of Liguria, a Roman colony, on the river Tanarus, now called Asti.

ASTA, or **ASTA REGIA**, a town of Baetica, situated at the mouth of the Bætis, which was choked up with mud, north of Cadiz, and sixteen miles distant from its port. Its ruins show its former greatness. Its name is Phœnician, denoting a frith or arm of the sea. It is said to be the same with the present Xeres.

ASTABAT, a town of Armenia, in Asia, three miles from the river Aras, and twelve south of Nakshivan. The land about it is excellent, and produces very good wine.

ASTÆUS, a species of the crab insect.

ASTAKILLOS, a denomination given by Paracelsus to a malignant gangrenous ulcer in the legs, occasioned by a mercurial salt in the blood. It is also called by him araneus, and ulcus araneum, the spider's ulcer.

ASTANDA, in antiquity, a royal courtier or messenger; the same with Angarus. Darius king of Persia, is said by Plutarch, in his book on the fortunes of Alexander, to have formerly been an astanda.

ASTARILÆ, **ASTARITA**, or **ASTAROTHITES**, a name given to those Jews who worshipped Asherah Ammon, in Arabia Petreea.

ASTARTE, in ancient geography, a city on the other side Jordan; one of the names of Rablah Ammon, in Arabia Petreea.

ASTARTE, in pagan mythology. See ASHTAROTH. On a medal of Cesarea Palestina, Astarte is represented as in the annexed figure, in a short habit, crowned with battlements, holding the head of Osiris in her right hand, and a staff in her left, inscription *COLONIA Prima Felix AUGusta Flavia Commodiana, &c.*

ASTATE. See **ESTATE**.

The worlde stante ever upon debate,
So maie be siker none astate,
Now here, now there, now to, now fro,
Now up, now down, the world goth so,
And ever hath done, and ever shall.

Gower. Con. A. The Prologue.

ASTATI, in the ninth century, the followers of one Sergius, who renewed the errors of the Manichees. They prevailed much under the emperor Nicephorus; but his successor, Michael Cuperpalates, curbed them with very severe laws.

Voi. III.

ASTEEPING. In steeping. See **STEEP**.

Where Peral's flowers
Perfume proud Babel's bowers,
And paint her wall:
There we lay'd *asterping*
Our eyes in endless weeping,
For Sion's fall.

P. Fletcher's Poems, p. 163.

ASTEISM, in rhetoric, a pleasant kind of irony, or handsome way of deriding another. Such, e. g. is that of Virgil:

Qui Buvium non odit, amet tua carmina, Mavi, &c

ASTELL (Mary) was the daughter of an opulent merchant at Newcastle-upon-Tyne, where she was born about 1668. She was educated in a manner suitable to her station; and amongst other accomplishments was mistress of the French, and had some knowledge of the Latin tongue. Her uncle, a clergyman, observing in her marks of a promising genius, took her under his tuition, and taught her mathematics, logic, and philosophy. She left the place of her nativity when she was about twenty years of age, and spent the remaining part of her life in London and at Chelsea. Here she pursued her studies with great assiduity, made great proficiency in the above-mentioned sciences, and acquired a more complete knowledge of the classics. Among these Seneca, Epictetus, Hierocles, Antoninus, Tully, Plato, and Xenophon were her favorites. She wrote, 1. A Serious Proposal to the Ladies. 2. An Essay in Defence of the Female Sex. 3. Letters concerning the Love of God. 4. Essays upon Marriage, Crosses in Love, and Friendship. 5. Moderation truly stated. 6. The Christian Religion, as professed by a daughter of the Church of England. 7. Bart'lemy Fair, or an Enquiry after wit; and other works. She died in 1731, aged sixty-three, and was buried at Chelsea.

ASTENA, a genus of worms of the mollusca order, in the Linnaean system.

ASTER, in ancient pharmacy, a kind of medicine, invented by Andromachus, against defluxions and divers pains.

ASTER, in botany, starwort, a genus of the polygamia superflua order, and syngenesia class of plants; ranking in the natural method under the forty-ninth order, composite discoides. The receptacle is naked; the pappus simple; the rays of the corolla ten; and the calyx imbricated. There are above thirty species. All of them may be raised from seed sown either in autumn or spring: but the greater part being perennial plants, and increasing greatly at the roots, are generally propagated by parting their roots early in the spring. They will grow in almost any soil or situation; and the larger sorts increase very fast. They grow best in the shade: the lower kinds do not run so much at the root, but should be taken up and transplanted every other year; which will make them produce much fairer flowers. Some few sorts which are natives of warm climates, will require artificial heat to raise them, if not to preserve them.

ASTER, in mineralogy, a species of Samian earth.

ASTERABAD, a small province of Persia, bounded on the west by the Caspian sea, on the

G

south by the districts of Damgan and Bistan, and on the north and east by the river Ashor. This province is the ancient Hyrcania, and the paternal estate of the present king of Persia, as chief of the tribe Kajar, or Kujur, which has entire possession of it. The capital is situated on the south-east shore of the Caspian sea, at the mouth of the river Aster, or Ester. It was destroyed by Tamerlane, and is now governed by a descendant of the reigning family of Persia. 300 miles N. N. E. of Ispahan. Long. 54° E., lat. 36° 44' N.

ASTERAC, or **ESTERAC**, a ci-devant district of France, in Armagnac, now included in the department of Gers. It is fertile and populous.

ASTERIA, a gem, sometimes called the cat's eye, or oculus felis. It is a very singular and beautiful stone, and somewhat approaches to the nature of the opal, in having a bright included color, which seems to be lodged deep in the body of the stone, and shifts about, as it is moved, in various directions: but it differs from the opal in all other particulars, especially in its want of the great variety of colors seen in that gem, and in its superior hardness. It is usually found between the size of a pea and the breadth of a six-pence; is almost always of a semicircular form, broad and flat at the bottom, and rounded and convex at the top; and is naturally smooth and polished. It has only two colors, a pale brown and a white; the brown seeming the ground, and the white playing about in it, as the fire color in the opal. It is considerably hard, and will take a fine polish, but is usually worn with its native shape and smoothness. It is found in the East and West Indies, and in Europe. The island of Borneo affords some very fine ones, but they are usually small; they are very common in the sands of rivers in New Spain; and in Bohemia they are often found immersed in the same masses of jasper with the opal.

ASTERIA, an extraneous fossil, called in English the star-stone. These fossils are small, short, angular, or sulcated columns, between one and two inches long, and seldom above a third of an inch in diameter: composed of several regular joints; when separated, each resembles a radiated star. They are, not without reason, supposed to be a part of some sea-fish petrified, probably the asterias or sea-star. The asteria is also called astrites, astroites, and asteriscus. They may be reduced to two kinds: those whose whole bodies make the form of a star; and those which in the whole are irregular, but are adorned as it were with constellations in the parts. The asterias spoken of by the ancients appears to be of this latter kind. The quality of moving in vinegar, as if animated, is scarcely perceptible in the astrites, but is signal in the asteria. The former must be broken in small pieces before it will move; but the latter will move, not only in a whole joint, but in two or three knit together. The curious frequently meet with these stones in many parts of England.

ASTERIA, in zoology, a name by which some authors have called the *falco palumbarius*, or gos-hawk. See **FALCO**.

ASTERIAS, star-fish, or sea-star, in zoology, a genus of insects of the order of vermes mol-

lusca. It has a depressed body, covered with a coriaceous coat; is composed of five or more segments, running out from a central part, and furnished with numerous tentacula; and has the mouth in the centre. The tentacula resemble the horns of snails, but serve the animal to walk with. They are capable of being contracted or shortened: and it is only at the creatures moving that they are seen of their full length; at other times, no part of them is seen but the extremity of each, which is formed like a sort of button, being somewhat larger than the rest of the horn. Aristotle and Pliny called this genus *αστηρ*, and *stella marina*, from their resemblance to the pictured form of the stars of heaven; and they asserted that they were so exceedingly hot, as instantly to consume whatsoever they touched! The fossil world has been greatly enriched by the fragments and remains of the several pieces of star-fish which have been converted into stones. See **ASTERIA**. There are many species of this genus: some of twelve, thirteen, and even fourteen rays. Most of them are found in our seas. We enumerate the principal: 1. *A. caput mediceæ*, or arborescent sea-star, having five rays issuing from an angular body; the rays divided into innumerable branches, growing slender as they recede from the base. These the animal, in swimming, spreads like a net; and when he perceives any prey within them, draws them in again. It is called by some the Magellanic star-fish, and basket-fish. 2. *A. clathara*, or cancellated sea-star, with five short thick rays, hirsute beneath, cancellated above, is found on our coasts, but is rare. 3. *A. decacnemos* having ten very slender rays, with numbers of long beards on the sides; the body small, and surrounded beneath with ten filiform rays. It inhabits the western coasts of Scotland. 4. *A. glacialis*, with five rays, depressed, round at the base, yellow, and having a round striated operculum on the back, is the most common; it feeds on oysters, and is very destructive to the beds. 5. *A. hispida*, with five rays, broad, angulated at top, and rough, with short bristles, is of a brown color, and found about Anglesea. 6. *A. oculata*, with five smooth rays, dotted or punctured, is of a fine purple color, also found about Anglesea. 7. *A. placenta*, with five very broad and membranous rays, extremely thin and flat, found about Weymouth. 8. *A. spherulata*, with a pentagonal indented body; a small globular head between the base of each ray; the rays slender, jointed, taper, and hirsute on their sides; found off Anglesea.

ASTERIAS, in ornithology, the ancient name of the bittern. See **ARDEA**.

ASTERION, in astronomy, one of the canes venatici.

ASTERISCUS, in botany, *asterodes bupthalmum*, the ox eye.

ASTERISK, { Gr. *Αστερισκος*, a diminutive

AS'TERISM. } of *αστηρ*, a star. Asterisms denote a number of stars, a constellation. Asterisk is a character of reference used in printing, resembling a small star.

Dwell particularly on passages with an *asterism*, for the observations which follow such a note, will give you a clear light.

Dryden's Dufresnoy.

Poetry had filled the skies with *asterisks*, and histories belonging to them; and then astrology devises the feigned virtues and influences of each.

Bentley's Sermons.

He also published the translation of the Septuagint by itself; having first compared it with the Hebrew, and noted by *asterisks* what was defective, and by obelisks what was redundant.

Grew.

ASTERIUS, or **Asturius**, a Roman consul, who lived about A. D. 449. He wrote A Conference on the Old and New Testament, in Latin verse, which is extant, and in which each strophe contains, in the first verse, an historical fact in the Old Testament, and in the second an application of that fact to some point in the New.

ASTERN. On the stern. See **STERN**.

Having left this strait *astern*, we seemed to be come out of a river of two leagues broad, unto a large and main sea.

The World encompassed by Sir F Drake, 1578.

The galley gives her side, and turns her prow,
While those *astern* descending down the steep,
Through gaping ways behold the boiling deep.

Dryden.

But at seven in the evening, finding we did not near the chase, and that the Wager was very far *astern*, we shortened sail, and made signal for the cruisers to join the squadron.

Anson's Voyage, p. 50.

ASTERN is used to signify any thing at some distance behind the ship; being the opposite of *a-head*, which signifies the space before her. See **AHEAD**.

ASTEROPÆUS, a Trojan hero, who fought with Achilles, in single combat, and proved him not invulnerable, by wounding him in the right arm; notwithstanding which Achilles slew him.

ASTEROPHYTON, in natural history, a kind of fish composed of a great number of cylindric rays, each branching out into several others, so as to represent the branched stalks of a very intricate shrub.

ASTEROPODIUM, a kind of extraneous fossil, of the same substance with the asteria or star-stones, to which they serve as a base. See **ASTERIA** and **STAR-STONE**.

ASTESAN, the ancient county of Asti, a district of Upper Italy, bounded by Chieri and Carmagnola on the west, by the Vercellois on the north and east, and by the marquisate of Gorzegno on the south. It is a fruitful and populous territory, about twenty-five miles long and ten broad, and belongs to the house of Savoy. It produces excellent wines, and exports to various parts of Italy large quantities of olives.

ASTETE'S ISLAND, an island to the northwest of the gulf of Carpentaria, New Holland, containing some traces of iron ore, and well wooded.

ASTHMA, a frequent, difficult, and short respiration, joined with a hissing sound and a cough, especially in the night-time, and when the body is in a prone posture; because then the contents of the lower belly bear so against the diaphragm, as to lessen the capacity of the breast, whereby the lungs have less room to move. See **MEDICINE**.

ASTI, a city of Montserrat in Italy, capital of the county. It has a bishop's see; is well fortified with strong walls and deep ditches: and is divided into the city, borough, citadel, and castle.

There are a great many churches, convents, and other handsome buildings in it. It is seated on the Tanaro, twenty-four miles east of Turin. Population 22,000. The inhabitants carry on a considerable trade in corn, wine, and silk, which is promoted by the situation of the town on the high-road from Alessandria to Turin.

ASTIGI, in ancient geography, a colony, and conventus juridicus, of Bœtica, situated on the Singulus, which falls into the Bœtis; called also *Colonia Astigitana*, and *Augusta Firma*; now Ecy, midway between Seville and Corduba.

ASTIP'ULATE, } To make an agreement.

ASTIP'ULATION. } See **STIPULATE**.

I do by my royal authority, confirm to persons of monastical religion, and by the consent and *astipulation* of my princes and peers do establish and consign to them that monastery.

Bp. Hull's Polemical Works, p. 187.

Shortly, all, but a hateful Epicurus, have *astipulated* to this truth.

Id. Devotional Works.

ASTIPULATOR, among the Roman Catholics, he by whose consent and leave a nun takes the religious habit.

ASTLE (Thomas), an English antiquary, was the son of a farmer in Staffordshire. After he had received a liberal education, Mr. Grenville took him under his patronage, and about 1763 gave him a place along with Sir Joseph Ayloffe and Dr. Ducarel, in the superintendance of the Westminster records. In 1766 he was chosen to conduct the printing of the ancient records of parliament; and in 1775 was appointed principal clerk in the record office in the Tower; from which, on the death of Sir John Shelly, he succeeded to the office of keeper of the records. He died in December 1803, and was the author of many curious papers in the volumes of the *Archæologia*; also of a work entitled *Origin and Progress of Writing*, as well hieroglyphic as elementary; which was first printed in 1784, 4to, and again in 1803.

ASTLEY (John), a native of Wem in Shropshire, though he studied painting under the same master with Sir Joshua Reynolds, is more memorable as a favorite of fortune, than as a limner. His best pictures are copies of the Bentivoglio's, Titian's *Venus*, &c. Lady Daniel, having sat to him for her picture, within a week after gave him the original, with the estate of Duckenfield, worth £5000 a year. He died in 1787.

ASTLEY (Philip), the founder of the royal amphitheatre near Westminster Bridge, was born at Newcastle-under-line in 1742, and bred a cabinet-maker. In 1759 he enlisted in the Light Horse, and served seven years in Germany, where he acquired the reputation of a good soldier. On his return home, he began to exhibit equestrian performances; and in 1780 erected a building which he called the amphitheatre riding house, for which he subsequently procured a license. In 1794 Mr. Astley went to the continent as a volunteer in the army. This campaign led to the publication of his *Descriptive and Historical Account of the places now the theatre of war in the Low Countries*, with plans of fortifications; London, 1794, 8vo; and *Remarks on the Profession and Duty of a Soldier*. Mr. Astley built amphitheatres at Dublin and at Paris, and the

Olympic Pavilion near the Strand. He closed an active and diversified life at Paris, October 20th, 1814, at the age of seventy-two. Another work of his is entitled A System of Equestrian Education, exhibiting the Beauties and Defects of the Horse, 1800, 4to.

ASTOMI, in anthropology, a people feigned to be without mouths. Pliny speaks of a nation of Astomi in India, who lived only by the smell or effluvia of bodies taken in by the nose!

ASTON (Sir Arthur), a commander in the service of Charles I. was at the head of the dragoons at the battle of Edgehill, and three times defeated the earl of Essex. He was successively governor of Reading and Oxford. He had the misfortune to break one of his legs in such a manner as to make amputation necessary; and, serving in Ireland after the death of the king, when Cromwell took Drogheda, where Aston was governor, his brains were beaten out with his wooden leg.

ASTON (Sir Thomas), of an ancient family in Cheshire, was created baronet in 1629, and appointed high sheriff of Cheshire in 1635. He raised a troop of horse for king Charles I., but was defeated and wounded in the vicinity of Nantwich in 1642. He was afterwards made prisoner, and carried to Stafford; and, while endeavouring to make his escape, a soldier struck him on the head, which, with other wounds he had received, brought on a fever, which ended in his death, in 1643. Sir Thomas was author of, 1. A Remonstrance against Presbytery, 1641, 4to; 2. A Short Survey of the Presbyterian Discipline; 3. Brief Review of the Institution, Succession, and Jurisdiction of Bishops.

ASTONE ,	Ang.-Sax. <i>stunian</i> , to stun. Old Fr. <i>estonne</i> ,
ASTONY ,	amaze, to excite wonder,
ASTON'YING ,	surprise; to strike as with
ASTON'IEDNESS ,	thunder, startle, stupify,
ASTON'ISH ,	confound, benumb; to ston-
ASTON'ISHEDLY ,	ny, or, as we say in modern
ASTON'ISHING ,	phrase, to petrify. As-
ASTON'ISHINGLY ,	tound is from the same
ASTON'ISHMNT ,	root, and of a correspond-
ASTOUN'D.	ing signification.

But netheles how that it wende
He drad hym of his owne sonne
That maketh hym well the more *astone*.

Gower. Con. A. book vi.
And with this word she fell to ground
Aswoun, and there she lay *astound*.

Id. ib. l. iv.
And anoon all the puple seynge Jhesus was
astonysed and thei dredden, and thei rennyngre gretten
him. *Wiclf. Mirk, chap. ix.*

Be *astonysched*, (O ye beauēs), be afayde, and
abashed at soch a thinge, sayethe the Lord. For my
people dowe two euels. *Bible, 1539. Jeremy, c. ii.*

Her looks did so *astonish me*,
And set my heart a quaking;
Like stag that gar'd, I was amaz'd,
And in a stranger taking.

Belchier, in Ellis, vol. iii.

These thoughts may startle well, but not *astound*,
The virtuous mind; that ever walks, attended
By a strong siding champion, conscience. *Milton.*

Now they lie
Groveling and prostrate on yon lake of fire,
As we ere while, *astounded* and amaz'd,
No wonder, fall'n such a pernicious height.

Milton. Paradise Lost, b. i.

Princes, potentates,

Warriors, the flow'r of heaven, once yours, now lost,
If such *astonishment* as this can seize
Immortal spirits.

Id.

But all sate mute,
Pondering the danger with deep thoughts; and each
In other's countenance read his own dismay
Astonisht.

Id. b. ii.

As when some peasant in a bushy brake,
Has with unwaried footing pressed a snake ;
He starts aside, *astonish'd*, when he spies
His rising crest, blue neck, and rolling eyes.

Dryden's Virgil.

The palaces of Peru and Mexico were certainly mean and inconvenient habitations, if compared to the houses of European monarchs; yet who could forbear to view them with *astonishment*, who remembered that they were built without the use of iron.

Johnson.

Whence many wearied e'er they had o'erpast
The middle stream (for they in vain have tried)
Again return'd *astounded* and aghast,
No one regardful look would ever backward cast.

Gilbert West.

A genius, universal as his theme,
Astonishing as chaos. *Thomson.*

At first, heard solemn thro' the verge of heaven
The tempest growls; but as it nearer comes,
And rolls its awful burden on the wind,
The lightning's flash a larger curve, and more
The noise *astounds*. *Thomson's Seasons.*

Unmanly dread invades

The French *astony'd*. *J. Philips.*

Astonishment is that state of the soul in which all its motions are suspended, with some degree of horror.

Burke on the Sublime and Beautiful.

A character so exalted, so strenuous, so various, so authoritative, *astonished* a corrupt age, and the treasury trembled at the name of Pitt, through all her classes of venality.

Grattan's Character of Lord Chatham.

ASTORCHIA, in botany, a name given by some botanists to the stoechas.

ASTORGA, an ancient city of Spain, in the kingdom of Leon, with a bishop's see, seated on the river Tuerto, and well fortified. It stands in a most agreeable plain, about 160 miles northwest of Madrid. It is now the chief place in a small marquisate, the castle of which it contains. In its territory lies the lake of Sanabria, through which the Tuerto passes with such rapidity as to agitate the whole surface.

ASTRÆA, in astronomy, a name of the sign Virgo, by others called Erigone, and sometimes Isis.

ASTRÆA, in mythology, the goddess of justice, and daughter of Jupiter by Themis, or, as others say, by Nemesis, the goddess of vengeance. The poets feign that Astræa quitted heaven to reside on earth, in the golden age; but, growing weary of the iniquities of mankind, she left the earth, and returned to heaven, where she commenced a constellation of stars, and from her orb still looks down on the ways of men.

ASTRAGAL, in architecture, a little round moulding, which in the orders surrounds the top of the shaft or body of the column. Its etymo-

logy is derived from its resemblance to the bone of the heel, called astragalos. It is also called the talon and tondino; it is used at the bottoms as well as the tops of columns, and on other occasions; it properly represents a ring, on whatever part of a column it is placed; and the original idea of it was that of a circle of iron put round the trunk of a tree used to support an edifice, to prevent its splitting. The astragal is often cut into beads and berries, and is used in the ornamented entablatures to separate the several faces of the architrave. See ARCHITECTURE.

ASTRAGAL, in gunnery, a round moulding encompassing a canon, about half a foot from its mouth.

ASTRAGALOIDES, in botany, the phaea of Linnæus.

ASTRAGALOMANCY; from *αστραγαλος*, and *μαντεια*, divination; a species of divination performed by throwing small pieces, with marks corresponding to the letters of the alphabet; the accidental disposition of which formed the answer required. This kind of divination was practised in a temple of Hercules at Achæa.

ASTRAGALOTE, in natural history, a species of fossile alum, thus called from its resembling a talus, or ankle-bone; whence it is also denominated *talare*.

ASTRAGALUS, in anatomy, the bone of the heel. See ANATOMY.

ASTRAGALUS, in botany, milk-vetch, or liquorice vetch; a genus of the decandria order, and diadelphia class of plants; ranking in the natural method under the thirty-second order, papilionacea; the pod is gibbous and bilocular. Of this genus there are thirty-nine species. 1. *A. communis*, the common species, grows wild upon dry uncultivated places, and is often recommended by Mr. Anderson as proper food for cattle. 2. *A. tragacantha*, a thorny bush, growing in Crete, Asia, and Greece, which yields the gum *tragacanth*. This is of so strong a body, that a dram of it will give a pint of water the consistence of a syrup, which a whole ounce of gum Arabic is scarce sufficient to do. Hence its use for forming troches and the like purposes, in preference to the other gums.

ASTRAKHAN, a city and government of the Russian empire, on the shores of the Caspian, anciently an independent Tatarian sovereignty, but reduced to a Russian province by the Tzar Ivan Vasilievich in 1554. It forms a distinct province, named after its principal city; having been separated from that of Caucasus, in which it was formerly included. It is bounded by the governments of Caucasus, Saratov, Orenburg, the country of the Kirgiz Tartars, the Caspian Sea, and the ci-devant Persian provinces of Daghستان and Iergistan; and contains 12,568 square geographical miles. The number of its inhabitants is from 300,000 to 400,000. Its extent from east to west is about 600 geographical miles, and from north to south about 520. The climate is rather warm, the thermometer rising in the summer to 158° (Fahrenheit); but the nights are cold, and the dew very copious. The ice is usually strong enough to bear at the end of November, and is not melted again till February.

This is followed by violent storms; but spring soon advances, the ground is covered with flowers, and the whole face of nature changed. The summer is remarkably dry. This government is separated from that of Kazan and the Kozaks of the Ural, by a barren branch of the Uralian chain, which stretches from north to south, and is the only line of hills in this province. The rest of the government is one continued level. The principal rivers, besides the Volga and Ural, are the Akhtuba, running parallel with the Volga, the Manich, the great and little Uzen, the Kuban, the Kuma, lost in the summer months in the sands, the Terck, the Malka, and the Sula. The air in the Steppes is said to be very unhealthy. At a distance from the stream the soil becomes salt and barren, and is covered with drifting sand. There are several salt lakes, such as the Bogdo, Basinskoo, Graznoć, Kobilkha, &c.

On the banks of the Volga rhubarb and liquorice are plentiful, and the extract from the root of the latter is prepared in considerable quantities in the city of Astrakhan. The sea-rose, found near the mouth of the Volga, is here considered as sacred and nutritious. Its flowers have a fragrant smell, and give an essential water of the scent of amber. The shrubs of the Steppes are cherries, sloes, dwarf almonds, and capers. Near the river there are the willow, alder, birch, ash, poplar, elm, and oak; the beech also on the Kuban; but no large woods. The fruit trees are Tatarian mulberries, cherries, apples, pears, plums, apricots, peaches, quinces, and vines; and on the latter there are also figs, almonds, wild olives, Spanish chestnuts, pomegranates, and Cornelian cherries (*Cornus mas*), which, when pickled, taste like olives. Silk, tobacco, and cotton are plentiful; and the gardens produce all the common roots and herbs. The pastureage is excellent, and much cattle is reared. Sea and rock-salt, natron, epsom-salt, salt-petre-earth, bitumen, and mineral pitch, are also an abundant source of wealth to Astrakhan.

The population of the province is composed of a great number of different nations; Russians, Kozaks, Tartars, Kalmuks, Indians, Persians, Armenians, &c. Generally the military, public officers, merchants, mechanics, and other citizens, are Russians. The garrisons on the Ural consist of Kozaks, derived from those of the Don, who choose their own officers, except their commander, the hetman, or atayau, who is appointed by the Russian government. The Tartars are, excepting a small number, nomad tribes, continually encamped, consisting of about 9000 families. The Kalmuks, about 12,000 families, are of the Derbet tribe, and encamp between the Volga, Don, and Kuma. There are also Armenians, Greeks, Georgians (Gruzinins), Bukharians, Khivinziāns, and Hindoos, inconsiderable numbers, constantly inhabiting the city, to say nothing of the Europeans who are generally to be found there. Some colonies, established on the Terek and Kuma in 1781, cultivate grain, gardens, and vineyards, and produce a considerable quantity of silk. The number of their villages amounted to fifty-three in 1796.

ASTRAKHAN, the capital of the above government, (called originally Hajé Terkhan, the

Giterchan, or Ginterchan, of the middle ages), is situated in E. long. $48^{\circ} 2' 15''$, N. lat. $46^{\circ} 21' 12''$, and is one of the most populous and important cities, ranking as the third town, perhaps, of the Russian empire. It contains nearly 70,000 inhabitants. It stands on a hill, in a long narrow island of the Volga, about thirty miles from its entrance into the Caspian, surrounded by swamps, which in spring are very unhealthy. The town itself, without including the suburbs, is from six to eight miles in circumference. The houses are built principally of brick and sand-stone. Here is an old Tatar castle, or kreml, and the Beloi-Gorod (white tower), built by the tsar, Michael Feodorovich, now in ruins; a cathedral, archbishop's palace, public offices, main guard, arsenal, and powder magazine. Belgorod, which adjoins the kreml, on the same hill, is 2510 feet long, 1440 feet broad, and 7110 feet in circumference. The city has four gates, and some ruined walls. The streets are ill paved, and much exposed to inundations. Between the kreml and the canal, on the Volga, is the dock-yard, on the other side of which are the Tatarian and Armenian suburbs (slobods), and barracks for the troops. The exchange, where ships from the Caspian unlade and land their goods, is not far from St. Nicolas's Gate, and opposite to it is the haven for vessels coming down the river. Within the suburbs are about 100 vineyards, thirty of which belong to the crown; a school for the artillery, a bank, and court of justice, in what was formerly the Troitzkoï convent; and, in the Belograd, the Spasso-preobrashenski convent, two parish churches, two hospitals, and a bazar for the use of the Armenians and Hindoos.

The variety of nations and religions in Astrakhan is manifested by the number and difference of the places of worship. The total of them is fifty-seven: twenty-three Russian churches of the Greek communion; twenty-seven Tatarian mosques, churches, and temples; four Armenian, two Roman Catholic, one Lutheran, and one Hindoo temple. There is also a handsome hospital dedicated to St. Paul, and six monasteries; several dyeing-houses, brick-fields, tallow-candle manufactories, one iron-foundry, and looms for weaving linen, veils, and sashes. The morocco leather manufactured here is most esteemed, next to the Turkish; especially the red. There is also an establishment here for rearing silk-worms, and a botanic garden. European goods are brought either by water from Pittsburgh, or, on sledges, by land from Moscow, and are shipped across the Caspian, or conveyed to Mozdok, in Mount Caucasus. The merchants engaged in this trade employ 250 vessels of different tonnage. More than half of the whole trade carried on is in the hands of the Armenians. Many of the Russian merchants employ their vessels in trading voyages to Persia, Khiva, or Bukhara, or carrying stores to Kizlär, and salt, for the crown, to the towns on the Volga. The Hindoo merchants generally quit their native country at an early age, setting out with a small capital, which they soon increase by trade on their way through Tatar and Persia; and make enormous profits by letting the Tatars of Astrakhan

have their goods on credit; so that the latter are always deeply in their debt.

The imports from Persia and Bukhara consist of raw silk, about 120,000 lbs. yearly, wool, dyed woollens, madder, galls, morocco leather, chintzes, dyed linens, silks, gauzes, small carpets, counterpanes, frankincense, bezoar, naphtha, rice, deer-skins, lamb-skins, Circassian cloth, tulups (pelisses), mountain-honey, tobacco, cotton gowns, Persian peas, dried fruits, almonds, figs, pomegranates, olives, oil, saffron, dried peaches, and spices. The exports consist almost entirely of foreign manufactures; such as velvet, cochineal, satin, plush, linen, and other woven articles, sugar, Russia-leather, iron, dyeing substances, glass, coral, steel and iron wares, metal utensils, wrought gold and silver, wax, soap, trinkets, alum, quick-silver, vitriol, sal-ammoniac, &c. Caravans often arrive by land at Astrakhan from Bukhara and Khiva. The Indian trade alone is from 6 to 700,000 roubles (£120 to 140,000) annually. The silk-manufactures are said to employ from 3 to 400,000 (£60 to 80,000). The supplies sent to the Caucasian lines along the Terek, from 4 to 500,000 (£100 to 120,000). The prices of all internal produce are low. Little is known concerning the origin of Astrakhan or of its condition before the thirteenth century, when William de Rubruquis found it a village without any fortifications; but, at the close of that century, it was a considerable emporium for the trade with India and China; and completely ruined by Tipur. It was still a mere village when Josaphat Barbaro saw it in the fifteenth century; but Ambrosio Contareni, the Venetian ambassador, in the latter end of that century, found a considerable trade in rice and silk carried on there. The conquest of it, by the tsar Ivan Vasiliovich, in 1554, was therefore very advantageous to Russia, as it gave her the command not only of the Volga, but also of the Caspian, an advantage which she has not neglected to improve.

ASTRALISHI, among miners, is the ore of gold in its first state.

ASTRANTIA, MASTERWORT, in botany, a genus of the dignaria order, and the pentandria class of plants; ranking in the natural method under the forty-fifth order, umbellatae. The involucrum is lanceolated, open, equal, and colored. The species are two: 1. A. major. 2. A. minor, both natives of the Alps, and possessing no remarkable properties.

ASTRAPÆA, in natural history, a name given by the ancients to a stone, since called, improperly, astrapia, and by some astrapias. It was of a blue, or blackish ore, with white variegations, running in the form of waves and clouds. Some specimens of the Persian lapis lazuli are of this kind, but they are rare.

ASTRARII, in writers of the middle age, the same with mansionarii, those who live in the house or family, at the time when a person dies.

ASTRARIUS HERES; from astre, old French, a hearth; is used in our old writers, where the ancestor, by conveyance, hath set his heirs apparent, and his family, in a house, in his life-time.

ASTRAY'. According to Tooke, the past part. of the Ang.-Sax. verb strægan, to stray, to scatter.

First every day, beseech thy God on knee,
So to direct thy stagg'ring steppes alway;
That he which every secrete thought doth see,
May holde thee in, when thou wouldest goe astray.
Gascoigne.

You labour may

To lead *astray*,

The heart that constant shall remain,
And I the while
Will sit and smile,

To see you spend your time in vain.

George Wither, in Ellis, v. ii.

And darkness and doubt are now flying away,

No longer I roam in conjecture forlorn.

So breaks on the traveller, faint, and *astray*,

The bright and the balmy effulgence of morn.

Beattie's Hermit.

ASTRICT', v. & adj.

ASTRICK'TION,

ASTRICK'TIVE,

ASTRIN'GE,

ASTRIN'GENTLY,

ASTRIN'GENT, n. & adj.

Astringo, astrictum, astringere, to contract. To make strait or narrow, to heighten or draw close, to bind; opposed to relax.

Tears are caused by a contraction of the spirits of the brain; which contraction, by consequence, *astringeth* the moisture of the brain, and thereby sendeth tears into the eyes.

Bacon.

This virtue requireth an *astriction*; but such an *astriction*, as is not grateful to the body: for a pleasing *astriction* doth rather bind in the nerves, than expel them; and therefore such *astriction* is found in things of a harsh taste.

Id.

The juice is very *astringent*, and therefore of slow motion.

Id. Natural History.

What diminisheth sensible perspiration, encreaseth the insensible; for that reason, a strengthening and *astringent* diet often conduceth to this purpose.

Arbuthnot on Aliments.

The solid parts were to be relaxed or *unstricted*, as they let the humours pass, either in too small or too great quantities.

Id.

Lenitive substances are proper for dry atrabilian constitutions; who are subject to *astriction* of the belly, and the piles.

Id. on Diet.

Acid, acrid, austere and bitter substances, by their *astringency*, create horrour; that is, stimulate the fibres.

Id.

Astringent medicines are binding, which act by the asperity of their particles; whereby they corrugate the membranes, and make them draw up closer.

Quincy.

ASTRICTION, in law. See **THIRLAGE**.

ASTRICTION, in medicines, the operation of *astringent* medicines.

ASTRICUS LAPIS, in natural history, a kind of figured stone, broken or cut from the enastros, after the same manner as the trochitæ, from the entrochi.

ASTRID'E, } On stride, on straddle. See **ASTRA'DLE**. } *STRIDE*, and *STRADDLE*.

To lay their native arms aside,

Their modesty; and ride *astride*. *Hudibras.*

I saw a place, where the Rhone is so straitened between two rocks, that a man may stand *astride* upon both at once.

Boyle.

ASTRILD, in ornithology, a species of the *ioxia*.

ASTRINGENTS, in the *materia medica*, substances distinguished by a rough austere taste,

and changing solutions of iron, especially those made in the vitriolic acid, into a dark purple or black color; such as galls, tormentil root, bistort root, balaustines, terra japonica, acacia, &c.

ASTROBOLISM; from *αστηρ*, a star, and *βαλλω*, to strike; the same with sphacelus; though properly applied to plants which are destroyed in the dog-days, as if blasted by that star.

ASTROCHITES, or **ASTROITES**. See **ASTERIA**.

ASTROGNOSIA; from *αστηρ*, star, and *γνωστω*, I know; the art of knowing the fixed stars, their names, ranks, situations in the constellations, and the like. See **ASTRONOMY**.

ASTROLABE, } Gr. *αστηρ*, a star, and
As'TROLABRE, } λαμβανω, I take.
As'TROLABY.

The firste partie of this treatise shall rehearse the figures, and the members of thine *astrolaby*, because that thou shalt have the greater knowyng of thyne owne instrument.

Chaucer. Astrolabie, f. 262. c. i.

For I haue ben toward the parties of Braban, and beholden the *astrolabre*, that the sterre that is clept the transmontayne, is 53 degrees highe.

Sir John Maundeville.

Liv'd *Tyl* no now, struck with this ray which shone More bright the morn, than others beam at noon, He'd take his *astrolabe*, and seek out here What now star twas did gild our hemisphere.

Dryden. On the Death of Lord Hastings.

ASTROLABE, among the ancients, was the same as our armillary sphere.

ASTROLABE, among the moderns, is used for a planisphere, or a stereographic projection of the sphere, either upon the plane of the equator, the eye being supposed to be in the pole of the world, or upon the plane of the meridian, at the time the eye is supposed in the point of the intersection of the equinoctial and horizon.

ASTROLOGY, } As*τηρ*, a star, and *λογος*,
Astro'LOGER, } a discourse; from *λεγω*, I say. In Latin writers,
Astro'LOGIAN, } astrology was synonymous
Astro'LOGICK, } with, and more in use
Astro'LOGICALI, } than, astronomy. This usage has been imitated by our elder writers.
Astro'LOGICALLY.

On which was written, not in words,
But hieroglyphic mute of birds;
Many rare pithy saws concerning,
The worth of *astrologic* learning.

Butler's Hudibras, part i. can. 3.

A worthy *astrologer*, by perspective glasses, hath found in the stars many things unknown to the ancients.

Raleigh.

Not unlike that, which *astrologers* call a conjunction of planets, of no very benign aspect the one to the other.

Wotton.

Some seem a little *astrological*; as, when they warn us from places of malign influence.

Id.

No *astrologick* wizard honour gains,
Who has not oft been banish'd, or in chains.

Dryden.

A happy genius is the gift of nature: it depends on the influence of the stars, say the *astrologers*; on the organs of the body, say the naturalists; it is the particular gift of heaven, say the divines, both Christians and heathens.

Id.

Astrologers, that future fate foreshew.

Pope.

I never heard a finer satire against lawyers, than that of *astrologers*; when they pretend, by rules of art, to tell when a suit will end, and whether to the advantage of the plaintiff or defendant. *Swift.*

I know, the learned think of the art of *astrology*, that the stars do not force the actions or wills of men. *Id.*

Astrological prayers seem to me, to be built on as good reason, as the predictions. *Stillingfleet.*

The poetical fables are more ancient than the *astrological* influences; that were not known to the Greeks, till after Alexander the Great. *Bentley.*

The twelve houses of heaven, in the form which *astrologians* use. *Camden.*

ASTROLOGY; from *ἀστρος*, a star, and *λόγος*, discourse; was long considered as a science, by which future events could be foretold, from the aspects and positions of the heavenly bodies. In the literal sense of the term, *astrology* should signify no more than the doctrine or science of the stars; which was its original acceptation, and made the ancient astrology; though, in course of time, an alteration has arisen: that which the ancients called *astrology*, being afterwards termed *astronomy*. *Astrology* may be divided into two branches, natural and judicial.

ASTROLOGY, JUDICIAL OR JUDICIARY, is what we commonly call simple astrology, that which pretends to foretel moral events, i.e. such as have a dependence on the free will and agency of man; as if they were directed by the stars. This art, which owed its origin to the practices of knavery or credulity, is now universally exploded by the intelligent part of mankind. The professors of this kind of astrology maintain, ‘That the heavens are one great volume or book, wherein God has written the history of the world; and in which every man may read his own fortune, and the transactions of his time.—The art, they say, had its rise with the science of astronomy. While the ancient Assyrians, whose serene unclouded sky favored their celestial observations, were intent on tracing the paths and periods of the heavenly bodies, they discovered a constant settled relation of analogy between them and things below; and hence were led to conclude these to be the parcae, the destinies, so much talked of, which preside at our births, and dispose of our future fate. The laws therefore of this relation being ascertained by a series of observations, and the share each planet has therein; by knowing the precise time of any person’s nativity, they were enabled, from their knowledge in astronomy, to erect a scheme or horoscope of the situations of the planets, at that point of time; and hence, by considering their degrees of power and influence, and how each was either strengthened or tempered by some other, to compute what must be the result.’ Such are the arguments of the astrologers in favor of their science. The chief province now remaining to the professors of this art, is the making of calendars or Almanacks; and the prodigious sale of Moore’s almanack, in this country, is no small proof of the popular belief in this subject.

Judicial astrology is commonly said to have been invented in Chaldea, and thence transmitted to the Egyptians, Greeks, and Romans; though some will have it of Egyptian origin, and ascribe the invention to Ham. But it is to the

Arabs we owe it. At Rome the people were so infatuated with it, that the astrologers, or, as they were then called, the mathematicians, maintained their ground notwithstanding the edicts of the emperors to expel them out of the city. Domitian, in spite of his hostility to this art, trembled at its denunciations. They prophesied the year, the hour, and the manner of his death; and agreed with his father in foretelling, that he should perish, not by poison, but by the dagger. On the evening of his assassination he spoke of the entrance of the moon into Aquarius on the morrow. ‘Aquarius,’ he said, ‘shall no longer be a watery, but a bloody sign; for a deed shall there be done, which shall be the talk of all mankind.’ The dreaded hour of eleven approached. His attendants told him it was passed, and he admitted the conspirators and fell. *Suet. in Domit.* 16.

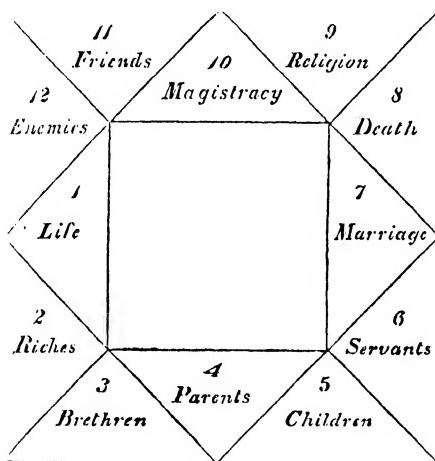

The Brahmins, who introduced and practised this art among the Indians, have hereby made themselves the arbiters of good and evil hours, which gives them great authority; they are consulted as oracles; and have taken care never to sell their answers but at good rates. The same superstition has prevailed in more modern ages and nations. The French historians remark, that in the time of Catherine de Medicis, astrology was so much in vogue, that the most inconsiderable thing was not to be done without consulting the stars. And in the reign of king Henry III. and IV. of France, the predictions of astrologers were the common theme of the court conversation. This predominant humor in that court was well rallied by Barclay, in his *Argenis*, on occasion of an astrologer, who had undertaken to instruct king Henry in the event of a war then threatened by the faction of the Guises.

Little is known of the early history of astrology in England. Bede and Alcuin, among our Anglo-Saxon ancestors, were addicted to its study; and Roger Bacon could not escape the imputation of the art. His imprisonment was owing, it is well known, to his being supposed skilful in it. But it was the period of the Stuarts which must be considered as the acme of astrology among us. Then Lilly drank the doctrine of the magical circle, and the invocation of spirits from the *Ars Notoria* of Cornelius Agrippa; used the form of prayer prescribed therein to the angel Salmonceus; and entertained among his familiar acquaintance the guardian spirits of England, Sammael and Malchidael. *Martin Anglicus*, 1647. The author of *Waverley* has made ample use of this promising character in his tales relative to this period.

The signs of astrology were primarily divided thus: the six first were called northern, and commanding; the six last southern, and obeying. Next they were distributed into four triplicities, (so called because three belonged to each), fiery, earthy, airy, and watery. Of these the fiery and airy were said to be masculine, the earthy and watery, feminine. The planets by their motion made several aspects. See **ASPECTS**. The remaining influential parts of the heaven were two, Dragon’s Head and Tail, that is the nodes in which the ecliptic is intersected by the orbits of the planets; and the Part of For-

tune, that is the distance of the moon's plane from the sun, added to the degrees of the ascendant.

The influences of the heavenly bodies being determined, it remained only, in each separate case, to observe their positions at some required moment; for upon this, and their aspect to each other, the resolution of any question depended. For this purpose the whole circle of the heavens was distributed into twelve parts or houses, by great circles drawn through the intersection of the horizon and meridian, and cutting the equator in so many equal parts. The first house was placed directly east, and the remainder were counted round in order proceeding to the south according to the motion of the planets. To each of these houses was assigned some peculiar government, according to the scheme below.

The remainder of the art consisted in accurately filling the scheme by an observation, and then framing from it an oracular response.

At the revolution astrology declined; and notwithstanding the labors of the immortal Partridge then, and those of Ebenezer Sibley, which in our own days fill two 4to. volumes, the art may now be considered as exploded.

ASTROLOGY, NATURAL, is the predicting of natural effects from natural causes; as, the changes of weather, winds, storms, hurricanes, thunder, floods, earthquakes, &c. This art properly belongs to physiology, or natural philosophy; and is only to be deduced a posteriori, from phenomena and observations.

ASTROLOMA, in botany; from *ἀστρον*, a star, and *λόπτης*, a fringe, alluding to the five tufts of hair which form a star, near the bottom of the tube of the flower, internally. Brown Prodri. Nov. Holl. v. i. 538. Class and order, pentandria monogynia. Nat. ord. Ericæ Juss. Euphractæ, brown.

Gen. ch. **CAL.** perianth inferior, permanent, double; inner of five elliptic-lanceolate, acute, equal, erect leaves; outer of four or more, much shorter, concave, imbricated scales: cor. of one petal, tubular; tube twice the length of the calyx,

inflated, furnished on the inside, near the base, with five tufts of soft hairs; limb in five deep, spreading, lanceolate, acute, hairy segments, shorter than the tube. Nectary a cup-shaped undivided gland, surrounding the base of the germen: **STAM.** filaments five, linear, inserted into the tube, and enclosed within it; anthers oblong, in the mouth of the tube: **PIST.** Germen superior, roundish, of five cells; style capillary, the length of the tube; stigma 'globose, densely downy': **PERIC.** drupa globular, slightly juicy: **SEED**, nut of five cells, hard and solid, not bursting, with pendulous oblong kernel in each cell.

Ess. ch.: outer calyx of several imbricated leaves: corolla tubular: tube swelling, twice as long as the calyx, with five internal tufts of hair at the base: tube shorter, spreading, bearded: filaments linear, within the tube: drupa almost dry, of five cells. This genus is closely related to stenanthera, as well as to melichrus. We might perhaps unite them all to stypelia.

Astroloma consists of shrubs, of humble stature, for the most part decumbent: leaves scattered, often ciliated: flowers axillary, erect. There are six species: 1. *A. humifusum*, diffuse astroloma; stem prostrate, much branched. Found in various parts of New Holland, on the south-west coast, as well as at Port Jackson and in Van Diemen's island. The remaining five species have all been found in the southern part of New Holland, by Mr. Brown, and apparently by no other botanist. We give their names from his work: 2. *A. prostratum*, prostrate astroloma; 3. *A. denticulatum*, toothed astroloma; 4. *A. pallidum*, pale astroloma; 5. *A. compactum*, compact astroloma; 6. *A. tectorum*, upright astroloma.

ASTROLUS, in natural history, a name given by authors to a white and splendid stone, small in size, and of a roundish figure, resembling the eyes of fishes.

ASTROMETEOROLOGIA, the art of foretelling the weather, and its changes, from the aspects and configurations of the moon and planets. It is a species of astrology, sometimes called meteorological astrology.

ASTRONIUM, in botany, a genus of the pentandria order, and the dicoccia class of plants. The male calyx consists of five leaves, and the corolla is quinquepetalous. Of the female the calyx and corolla are the same as in the male; the styli are three, and the seed is single. There is but one species, viz. *A. graveolens*, a native of Jamaica.

ASTRONOMICAL CALENDAR, an instrument engraved on copper plates, printed on paper, and pasted on a board, with a brass slider carrying a hair: it shows by inspection the sun's meridian altitude, right ascension, declination, rising, setting, amplitude, &c. to a greater degree of exactness than the common globes.

ASTRONOMICAL PLACE of a star, or planet, is its longitude, or place in the ecliptic, reckoned from the beginning of Aries in consequentia, or according to the natural order of the signs.

ASTRONOMICALS, a name used by some writers for sexagesimal fractions; on account of their use in astronomical calculations.

A S T R O N O M Y.

ASTRO'NOMY,	}	
ASTRO NOMICK,		From <i>αστρον</i> , a star,
ASTRONOMICAL,		and <i>νόμος</i> , a law.
ASTRONOMICALLY,		
ASTRON'OMER,		
ASTRON'OMIZE.		

Images *astronomically* framed under certain constellations to preserve from several inconveniences, as under the sign of the Lion the figure of a lion made in gold, against melancholic fancies, dropsies, plague, fevers. *Bp. Hall's Cases of Conscience.*

Our forefathers, marking certain mutations to happen in the sun's progress through the zodiac, they registrate and set them down in their *astronomical canons*. *Brown's Vulgar Errors.*

The old ascetick Christians found a paradise in a desert, and with little converse on earth, held a conversation in heaven; thus they *astronomized* in caves; and though they beheld not the stars, had the glory of heaven before them. *Brown's Chris. Mor.* ii. 9.

Astronomers: no longer doubt of the motion of the planets about the sun. *Locke.*

The old and new *astronomers* in vain
Attempt the heav'nly motions to explain. *Blackmore.*

Can he not pass an *astronomical* line,
Or dreads the sun th' imaginary sign;
That he should ne'er advance, to either pole? *Id.*
To this must be added the understanding of the globes, and the principles of geometry and *astronomy*. *Cowley.*

INTRODUCTION.

SECT. I. ETYMOLOGY AND DÉFINITION OF ASTRONOMY.

1. ASTRONOMY, a mixed mathematical science, teaching the knowledge of the celestial bodies; their magnitudes, distances, motions, revolutions, and eclipses: and it comprehends also a knowledge of the natural causes on which all celestial phenomena depend. Hence it is as much a branch of physics as of mathematics, and comprehends the theory of the universe.

SECT. II. HISTORY OF ASTRONOMY.

2. As Astronomy is the most sublime of all the sciences, so it is also the most useful, the most ancient, and, we may add, the most perfect. How can it be otherwise than sublime, when its object is the study of that theatre which our merciful Creator has vouchsafed to establish as an unerring testimony of his existence and his power. Wherever we turn we perceive immensity of operation, guided by the strictest regularity. We find revolutions, intricate and complex, but resolving themselves, by laws irrevocably fixed, into paths the most simple, and the most capable of suffering an increase of numbers without confusion. In another point of view it is sublime: the contemplation of its discoveries and its usefulness would convince the dreary-minded bigot, who sneers at human reason and its efforts, of the amazing extent to which that noblest gift of God to man can be extended. Astronomy is the proudest triumph of philosophy and of human reason. Its superior usefulness when compared with the other sciences can never be opposed: by it the navigator is conducted through

unknown seas with safety; and the merchant transports the produce or the surplus of one nation to increase the comforts or relieve the wants of another; in short, it affords the means of intercourse to all the inhabitants of the globe. If, from the folly of mankind, it has sometimes been compelled to effect the transportation of animosity and destruction, it has more frequently assisted the dissemination of arts, civilisation, and happiness. That it is the oldest science we shall more clearly ascertain when we trace, as we shall soon do, its history through the most ancient, and its improvements through the most modern, nations. If then astronomy is possessed of the highest antiquity, the greatest usefulness, and the utmost sublimity, it is an object of the most transcendent worth that can occupy the attention of the human mind.

3. None of the sciences appear to be of higher antiquity than astronomy. From the account given by Moses of the creation of the celestial luminaries, it appears extremely probable that our first progenitor received some knowledge of their nature and uses from his Almighty Creator himself. The Jewish rabbins have adopted this opinion: and, indeed, it is natural to think that no visible objects would more readily excite the curiosity, or appear more worthy of the contemplation of Adam in a state of innocence, than the celestial bodies.

4. Consistently with this, Josephus ascribes to Seth and his posterity a considerable degree of astronomical knowledge. He speaks of two pillars, the one of stone and the other of brick, called the pillars of Seth, upon which were engraved the principles of the science; and he says that the former was still entire in his time. But, be this as it may, it is evident that the great length of the antediluvian lives would afford such excellent opportunities for observing the heavenly bodies, that we cannot but suppose that the science of astronomy must have been considerably advanced before the flood. Josephus says, that longevity was bestowed upon them for the very purpose of cultivating the sciences of geometry and astronomy; observing, that the latter could not be learned in less than 600 years; 'for that period (he adds) is the grand year.'

5. By this remarkable expression is probably meant the period in which the sun and moon come again into the same situation in which they were at the beginning of it, with regard to the nodes, apogee of the moon, &c. 'This period (says Cassini), of which we find no intimation in any monument of any other nation, is the finest period that ever was invented; for it brings out the solar year more exactly than that of Hipparchus and Ptolemy; and the lunar month within about one minute of what is determined by modern astronomers.' If the antediluvians had such a period of 600 years they must have known the motions of the sun and moon more exactly than their descendants knew them for many ages after the flood. That remarkable expression in the book of Job, in which

the Deity is spoken of as the being who ‘maketh Arcturus, Orion, and the chambers of the south,’ is too striking to be overlooked.

6. Indeed, besides the motives of mere curiosity, which of themselves may be supposed to have excited people to a contemplation of the glorious celestial canopy, it is easy to see that some parts of the science answer such essential purposes to mankind that they could not long be dispensed with. And it has been remarked that traces of this science, in different degrees of improvement, have been found among all nations.

7. Upon the building of the Tower of Babel, it is supposed that Noah retired with his children, born after the flood, to the north-eastern part of Asia, where his descendants peopled the vast empire of China. It is said also that the Jesuit missionaries have found traditional accounts among the Chinese of their having been taught this science by their first emperor Fo-hi, who is supposed to be the same with Noah; and Kempfer asserts that Fo-hi discovered the motions of the heavens, divided time into years and months, and invented the twelve signs, into which they divide the zodiac, and which they distinguish by the following names: 1. the mouse; 2. the ox or cow; 3. the tiger; 4. the hare; 5. the dragon; 6. the serpent; 7. the horse; 8. the sheep; 9. the monkey; 10. the cock or hen; 11. the dog; and 12. the boar. They divide the heavens into twenty-eight constellations, or classes of stars, allotting four to each of the seven planets; so that the year always begins with the same planet; and their constellations answer to the twenty-eight lunar mansions used by the Arabian astronomers.

8. They do not, however, mark these constellations with the figures of animals, like most other nations, but by connecting the stars by straight lines, and denoting the stars themselves by small circles: so, for instance, the great bear would be marked as represented in plate IV. fig. 9.

9. The Chinese themselves have many records of the high antiquity of their astronomy; though not without suspicion of great mistakes. They ascribe the discovery of the pole-star, the invention of the sphere, and mariners’ compass, &c. to their emperor Hong-Ti, the grandson of Noah. But on more certain authority it is asserted by Gaubil that, at least 120 years before Christ, the Chinese had determined by observation the number and extent of their constellations as they now stand; the situation of the fixed stars with respect to the equinoctial and solstitial points; and the obliquity of the ecliptic, with the theory of eclipses; and that they were, long before that, acquainted with the true length of the solar year, the method of observing meridian altitudes of the sun by the shadow of a gnomon, and of deducing from thence his declination and the height of the pole.

10. The same missionary also says that the Chinese have yet remaining some books of astronomy which were written about 200 years before Christ; from which it appears that the Chinese knew the daily motion of the sun and moon, and the time of the revolutions of the planets, many years before that period. Du

Halde informs us that Tcheou-cong, the most skilful astronomer that ever China produced lived more than a thousand years before Christ, that he passed whole nights in observing the celestial bodies and arranging them into constellations, &c. At present, however, the state of astronomy is but very low in that country, although it is cultivated at Pekin by public authority, as in most of the capital cities of Europe. This is ascribed, by Dr. Long, to a barbarous decree of one of their emperors, to burn all the books in the empire excepting such as related to agriculture and medicine.

11. Astronomy, according to Porphyry, must have been of very ancient standing in the East. He informs us that when Babylon was taken by Alexander there were brought from thence celestial observations for the space of 1903 years; which therefore must have commenced within 115 years after the flood, or within fifteen years after the building of Babel. Epigenes, according to Pliny, affirmed that the Babylonians had observations of 720 years engraven on bricks.

12. Achilles Vattius ascribes the invention of astronomy to the Egyptians; and adds that their knowledge of that science was engraven on pillars, and by that means transmitted to posterity. Bailly, in his *Exquisite History of Ancient and Modern Astronomy*, endeavours to trace the origin of this science among the Chaldeans, Egyptians, Persians, Indians, and Chinese, to a very early period; and he maintains that it was cultivated in Egypt and Chaldea 2800 years before Christ; in Persia, 3209; in India, 3101; and in China, 2952 years before that era. He also apprehends that astronomy had been studied even long before this distant period, and that we are only to date its revival from thence.

13. M. Bailly, in investigating the antiquity and progress of astronomy among the Indians, examines and compares four sets of astronomical tables of the Indian philosophers, viz. that of the Siamese, explained by M. Cassini in 1689; that brought from India by M. le Gentil, of the Academy of Sciences; and two other manuscript tables, found among the papers of M. de Lisle: all of which agree together, and refer to the meridian of Benares. It appears that the fundamental epoch of the Indian astronomy is a conjunction of the sun and moon which took place at the distance of years 3102 A. A. C. And M. Bailly computes that such a conjunction really then happened.

14. He farther observes that at present the Indians calculate eclipses from observations made 5000 years ago; the accuracy of which, with regard to the solar motion, far exceeds that of the best Grecian astronomers. The lunar motions have been computed from the space through which that luminary passes in 1,600,984 days. They also use the cycle of nineteen years, the same as that ascribed by the Greeks to Meton. Their theory of the planets is better than that of Ptolemy, as they do not suppose the earth to be the centre of the celestial motions, and believe that Venus and Mercury move round the sun. Their astronomy also agrees with the most modern discoveries, with regard to the obliquity of the ecliptic and the acceleration of the

equinoctial points, &c. The inhabitants of Japan, of Siam, and of the Mogul's empire, have also been acquainted with astronomy from time immemorial; and the celebrated observatory at Benares is a monument both of the ingenuity of the Hindoos, and of their skill in that science.

15. In the Transactions of the Royal Society of Edinburgh, vol. ii, professor Playfair has given a learned and ingenious dissertation on the astronomy of the Brahmins, in which the great accuracy and high antiquity of the science among them is rendered extremely probable. It appears that their tables and rules of computation have peculiar reference to an epoch, and to observations 3000 or 4000 years A. C. It appears, too, that very considerable mathematical knowledge had been employed in their precepts and calculations. But amongst all these precepts and those calculations, perhaps none will strike the mind of the reader with greater force than the following, from which we shall find, without plucking a leaf from the never-fading laurels of Sir Isaac Newton, ~~that~~ the principle which he developed to the modern world, was discovered by the philosophers of the eastern, thousands of years before he existed: of the truth of this the following remarkable passage, translated by Sir William Jones, from the poem of Shirin and Ferhad: 'there is,' says the author of that poem, 'a strong propensity which dances through every atom and attracts the minutest particle to some peculiar object; from such propensity arises every motion perceived in heavenly or terrestrial bodies. It is a disposition to be attracted which taught hard steel to rush from its place and rivet itself on the magnet; it is the same disposition which impels the light straw to attach itself firmly on amber.'

16. We shall conclude this part of the history of Asiatic discoveries in the words of professor Playfair: 'That observations made in India, when all Europe was barbarous or uninhabited, and investigations into the most subtle effects of gravitation made in Europe near five thousand years afterwards, should thus come in mutual support of one another, is perhaps the most striking example of the progress and vicissitudes of science, which the history of mankind has yet exhibited.'

17. It appears too, that astronomy was not unknown to the Americans; though in their division of time they made use only of the solar and not of the lunar motions. The Mexicans, in particular, had a strange predilection for the number thirteen: their shortest periods consisted of thirteen days; their cycle of thirteen months, each containing twenty days; and their epoch of four periods of thirteen years each. This excessive veneration for the number thirteen arose, according to Siguenza, from its being the number of their greater gods. Clavigero also asserts it as a fact, that having discovered the excess of a few hours in the solar above the lunar year, they made use of intercalary days to bring them to an equality, as was done by Julius Cæsar in the Roman calendar—but with this difference, that instead of one day every four years, they interposed thirteen days every fifty-two years.

18. Among the ancients we find the name of Chaldean used often for astronomer or astrologer. Indeed both these nations pretended to a very high antiquity, and claimed the honor of producing the first cultivators of this science. The Chaldeans boasted of their temple or tower of Belus, and of Zoroaster, whom they placed 5000 years before the destruction of Troy; while the Egyptians boasted of their colleges of priests, where astronomy was taught, and of the monument of Osymandias, in which, it is said, there was a golden circle of 365 cubits in circumference, and one cubit thick, divided into 365 equal parts, according to the days of the year, &c. It is indeed evident that both Chaldea and Egypt were countries very proper for astronomical observations, on account of the extended flatness of the country, and the purity and serenity of the air. The tower of Belus, or of Babel itself, was probably an astronomical observatory; and the pyramids of Egypt, whatever they were originally designed for, might perhaps answer the same purpose; at least they show the skill of this people in practical astronomy, as they are all placed with their four fronts exactly facing the cardinal points of the compass.

19. The Chaldeans began to make observations soon after the confusion of languages, as appears from the observations found by Alexander on the taking of Babylon; and it is probable they began much earlier. They determined, with tolerable exactness, the length both of a periodical and synodical month. They discovered that the motion of the moon was not uniform; and they even attempted to assign those parts of the orbit in which the motion is quicker or slower. We are assured by Ptolemy that they were not unacquainted with the motion of the moon's apogee and nodes, the latter of which they supposed made a complete revolution in 6585 $\frac{1}{4}$ days, or a little more than eighteen years, and contained 223 complete lunations, which period is called the Chaldean Saros.

20. Ptolemy also gives us from Hipparchus several observations of lunar eclipses made at Babylon above 720 years A. A. C.; and Aristotle informs us that they had many occultations of the planets and fixed stars by the moon; a circumstance which led them to conceive that eclipses of the sun were to be attributed to the same cause. They had also no inconsiderable share in arranging the stars into constellations, and the comets did not escape their observation. Dialling was also practised among them long before the Greeks were acquainted with that science.

21. The Egyptians were much of the same standing in astronomy with the Chaldeans. Herodotus ascribes their knowledge in the science to Sesostris; but probably not the same whom Newton makes contemporary with Solomon, as they were acquainted with astronomy at least many hundred years before that era. We learn from the testimony of some ancient authors, that they believed the figure of the earth was spherical; that the moon was eclipsed by passing through the earth's shadow, though it does not certainly appear that they had any knowledge of the true system of the universe; that they attempted to measure the magnitude of the earth and sun,

though their methods of ascertaining the latter were very erroneous ; and that they even pretended to foretel the appearance of comets, as well as earthquakes and inundations. This science, however, gradually decayed, and in the time of Augustus it was entirely extinct among them.

22. Astronomy passed from Chaldea and Egypt to the Phoenicians, and was applied by that commercial people to the purposes of navigation ; and they, in consequence, became masters of the sea, and of almost all the commerce in the world. The Greeks, it is probable, derived their astronomical knowledge chiefly from the Egyptians and Phoenicians, by means of several of their countrymen who visited these nations for the purpose of learning the different sciences. Newton supposes that the division into constellations was made about the time of the Argonautic expedition ; but it is probable that most of them were of a much older date, and derived from other nations, though clothed in fables of their own invention.

23. The fable of Atlas supporting the heavens upon his shoulders, shows that some Mauritanian monarch of that name had made considerable advances in astronomical knowledge ; and his discoveries had probably been communicated to the Greeks. Several of the constellations are mentioned by Hesiod and Homer, who lived about A. A. C. 870. Their knowledge in this science however, was greatly improved by Thales the Milesian, and other Greeks, who travelled into Egypt, and brought from thence the chief principles of the science. Thales was born about A. A. C. 640, and he was the first among the Greeks who observed the stars, the solstices, and predicted the eclipses of the sun and moon.

24. The science was farther cultivated and extended by his successors Anaximander, Anaximenes, and Anaxagoras ; but especially by Pythagoras, who, about A. A. C. 577, brought from Egypt the learning of these people, taught it in Greece and Italy, and founded the sect of the Pythagoreans. He taught that the sun was in the centre of the universe ; that the earth was round ; that there were antipodes ; that the moon reflected the rays of the sun, and was inhabited like the earth ; that comets were a kind of wandering stars, disappearing in the further parts of their orbits ; that the white color of the milky way was owing to the united brightness of a great multitude of small stars ; and he supposed that the distances of the moon and planets from the earth, were in certain harmonic proportions to one another.

25. Philolaus, a Pythagorean, who flourished about A. A. C. 450, and asserted the diurnal motion of the earth on its own axis, was taught by Hicetas, a Syracusan. About the same time Meton and Euctemon flourished at Athens, where they observed the summer solstice, A. A. C. 432, with the risings and settings of the stars, and what seasons they answered to. Meton also invented the cycle of nineteen years, which still bears his name.

26. Eudoxus, of Cnidos, lived about A. A. C. 370, and was one of the most skilful astronomers and geometricians of antiquity, and the supposed inventor of many of the propositions in Euclid's

Elements. He introduced geometry into the science of astronomy, and travelled into Asia, Africa, Sicily, and Italy, to improve it : and we are informed by Pliny, that he determined the annual year to contain 365 days 6 hours, and also the periodical time of the planets, and made other important discoveries and observations. Calippus flourished soon after Eudoxus, and his celestial sphere is mentioned by Aristotle ; but he is better known by a period of seventy-six years which he invented, containing four corrected Metonic periods, and which commenced at the summer solstice, A. A. C. 330. About this time the knowledge of the Pythagorean system was carried into Italy, Gaul, and Egypt, by certain colonies of Greeks.

27. Vitruvius, however, represents the introduction of astronomy into Greece, in a manner somewhat different. He maintains that Berosus, a Babylonian, brought it immediately from Babylon itself, and opened an astronomical school in the isle of Cos. And Pliny says, that, in consideration of his wonderful predictions, the Athenians erected a statue to him in the gymnasium, with a gilded tongue. But if this Berosus be the same with the author of the Chaldaic histories, he must have lived before Alexander. About this time, or rather earlier, the Greeks having begun to plant colonies in Italy, Gaul, and Egypt, became acquainted with the Pythagorean system, and the notions of the ancient druids concerning astronomy. Julius Cæsar informs us that the latter were skilled in this science ; and that the Gauls in general were able sailors, which they could not be without a competent knowledge of astronomy ; and it is related of Pytheas, who lived at Marseilles in the time of Alexander the Great, that he observed the altitude of the sun at the summer solstices by means of a gnomon. He is also said to have travelled as far as Thule to settle the climates.

28. After Alexander's death the sciences flourished chiefly in Egypt, under the auspices of Ptolemy Philadelphus, and his successors. He founded a school there, which continued till the invasion of the Saracens, A. A. C. 650. From the founding of that school, the science of astronomy advanced considerably. Aristarchus, about A. A. C. 270, strenuously asserted the Pythagorean system, and gave a method of determining the sun's distance by the dichotomy of the moon.—Eratosthenes, who was born at Cyrene A. A. C. 271, measured the circumference of the earth by a gnomon ; and being invited to Alexandria, from Athens, by Ptolemy Euergetes, and made keeper of the royal library there, he set up for that prince those armillary spheres, which Hipparchus and Ptolemy the astronomer afterwards employed so successfully in observing the heavens. He also determined the distance between the tropics to be $\frac{1}{2}$ of the whole meridian circle, which makes the obliquity of the ecliptic in his time to be $23^{\circ} 51' \frac{1}{4}$.

29. The celebrated Archimedes, too, cultivated astronomy, as well as geometry and mechanics, determined the distances of the planets from one another ; and constructed a kind of planetarium or orrery, to represent the phenomena and motions of the heavenly bodies.

30. Not to mention many others of the ancients who cultivated astronomy, Hipparchus, who flourished about A. A. C. 140, was the first who applied himself to the study of every branch of that science. Ptolemy says he made great improvements in it; he discovered that the orbits of the planets are eccentric, that the moon moved slower in her apogee than in her perigee, and that there was a motion of anticipation of the moon's nodes: he constructed tables of the motions of the sun and moon, collected accounts of such eclipses, &c. as had been made by the Egyptians and Chaldeans, and calculated all that were to happen for 600 years: he discovered that the fixed stars changed their places, having a slow motion of their own from west to east; he corrected the Calippic period, and pointed out some errors in Eratosthenes's method for measuring the circumference of the earth; he computed the sun's distance more accurately than his predecessors: but his best work is a catalogue of the fixed stars, to the number of 1022, with their longitudes, latitudes, and apparent magnitudes, which, with most of his other observations, was preserved by Ptolemy in his Almagest.

31. From the time of Hipparchus, till that of Ptolemy, little progress was made in astronomy. He was born at Pelusium, in Egypt, in the first century, and made the greatest part of his observations at the celebrated school of Alexandria in that country. Profiting by those of Hipparchus, and other ancient astronomers, he formed a system of his own, which, though erroneous, was implicitly followed for many ages by all nations. He compiled a great work, called the Almagest, which contained the observations and collections of his predecessors in astronomy. This work was preserved from the conflagration of the Alexandrian library by the Saracens, and translated into Arabic, A. D. 827, and into Latin in 1230. The Greek original was not known in Europe till the beginning of the fifteenth century, when it was brought from Constantinople, then taken by the Turks, by a monk of Trapezond, named George, who translated it into Latin; and various other editions have been since made.

32. From A. D. 800, till the beginning of the fourteenth century, the western parts of Europe were immersed in gross ignorance, while the Arabians, profiting by the books they had preserved from the wreck of the Alexandrian library, cultivated and improved all the sciences, and particularly that of astronomy, in which they had many able professors and authors. The caliph Al Mansur first introduced a taste for the sciences into his empire. His grandson, Al Mamun, who ascended the throne in 814, was a great encourager and improver of the sciences, especially of astronomy. Having constructed proper instruments, he made many observations; determined the obliquity of the ecliptic to be $23^{\circ} 35'$; and under his auspices a degree of the circle of the earth was measured a second time in the plain of Singar, on the border of the Red Sea.

33. About this time Alferganus wrote elements of astronomy; and Albategnius, who flourished about the year 880, greatly reformed it, by comparing his own observations with those of Ptolemy. Hence he computed the motion of the

sun's apogee from Ptolemy's time to his own; settled the precession of the equinoxes at one degree in seventy years; and fixed the obliquity of the ecliptic at $23^{\circ} 35'$. The tables which he composed for the meridian of Aracta, were long esteemed by the Arabians.

34. After this, though the Saracens had many eminent astronomers, several centuries elapsed without producing any very valuable observations, excepting those of some eclipses observed by Ebn Younis, astronomer to the caliph of Egypt, by means of which the quantity of the moon's acceleration since that time may be determined. Other eminent Arabic astronomers were Arzathel, a Moor of Spain, who observed the obliquity of the ecliptic, and improved trigonometry by constructing tables of sines, instead of chords of arches, dividing the diameter into 300 equal parts. Alhazen his contemporary, wrote upon the twilight, the height of the clouds, the phenomenon of the horizontal moon, and first showed the importance of the theory of refractions in astronomy.

35. Ulug Beg, grandson of the celebrated Tamerlane, the Tartarian prince, a great proficient in practical astronomy, had very large instruments, particularly a quadrant of about 180 feet high, with which he made good observations. From these he determined the latitude of Samarcand, his capital, to be $39^{\circ} 27' 23''$; and composed astronomical tables for the meridian of the same so exact, that they differ very little from those constructed afterwards by Tycho Brahe.—His principal work was his catalogue of the fixed stars, made from his own observations in the year 1437.

36. At this period, almost all Europe was immersed in ignorance; which began to be dispelled by the settlement of the Moors in Spain. The emperor Frederic II. about 1230, also began to encourage learning; restoring some decayed universities, founding a new one in Vienna; and causing the works of Aristotle and Ptolemy's Almagest, to be translated into Latin. Two years after this, John de Sacro Bosco, that is of Halifax, compiled from Ptolemy, Albategnius, Alferganus, and other Arabic astronomers, his work, De Sphæra, which was held in the greatest estimation for 300 years after, and was honored with commentaries by Clavius and other learned men.

37. In 1240 Alphonso, king of Castile, not only cultivated astronomy himself but greatly encouraged others; and by the assistance of several learned men corrected the tables of Ptolemy, and composed those which were denominated from him the Alphonsine tables. About the same time Roger Bacon, an English monk, wrote several tracts relative to astronomy, particularly of the lunar aspects, the solar rays, and the places of the fixed stars; and about 1270 Vitello, a Polander, composed a treatise on optics, in which he showed the use of refractions in astronomy.

38. Till the time of Purbach, who was born in 1423, little farther improvement was made in this science. He composed new tables of sines for every ten minutes, making the radius sixty with four cyphers annexed. He constructed spheres and globes, and wrote several astronomical tracts, as a commentary on Ptolemy's Alman-

gest; some treatises on arithmetic and dialling, with tables for various climates; new tables of the fixed stars reduced to the middle of that century; and he corrected the tables of the planets, making new equations to them where the Alphonsine tables were erroneous. In his solar tables, he placed the sun's apogee in the beginning of Cancer; but retained the obliquity of the ecliptic $23^{\circ} 33'$, as determined by the latest observations. He also observed some eclipses, made new tables for computing them, and had just finished a theory of the planets, when he died in 1462, being only thirty-nine years of age.

39. Purbach was succeeded in these labors by his pupil and friend, John Muller, commonly called Regiomontanus, who completed the epitome of Ptolemy's *Almagest*, which Purbach had begun; and after the death of his friend was invited to Rome, where he made many astronomical observations. Being returned to Nuremberg in 1471, by the encouragement of Bernard Walther, a wealthy citizen, he made several instruments for astronomical observations, among which was an armillary astrolabe, like that used at Alexandria by Hipparchus and Ptolemy, with which, and a good clock, then but a late invention, he made many observations. He made ephemerides for thirty years to come, showing the lunations, eclipses, &c.; printed the works of many of the most celebrated ancient astronomers, and wrote the theory of the planets and comets, and a treatise on triangles, which contains several good theorems; computed a table of sines for every single minute, to the radius 1,000,000, and introduced the use of tangents into trigonometry.

40. After Muller's death, which happened at Rome in 1476, in his fortieth year, Bernard Walther collected his papers, and continued the astronomical observations till his own death. The observations of both were collected by order of the senate of Nuremberg, and published there in 1544 by John Schoner; they were also afterwards published in 1618 by Snellius, at the end of the observations made by the landgrave of Hesse, and lastly with those of Tycho Brahe in 1666.

41. Walther was succeeded, as astronomer at Nuremberg, by John Werner, a clergyman, who observed the motion of the comet in 1500; and wrote several tracts on geometry, astronomy, and geography, in a masterly manner; the most remarkable of which are those concerning the motion of the eighth sphere, or the fixed stars: in this tract, by comparing his own observations, made in 1514, with those of Ptolemy, Alphonsus, and others, he showed that the motion of the fixed stars, since called the precession of the equinoxes, is $1^{\circ} 10'$ in 100 years. He made also the first star of Aries 26° distant from the equinoctial point, and the obliquity of the ecliptic only $23^{\circ} 28'$; constructed a planetarium, representing the celestial motions according to the Ptolemaic hypothesis; and published a translation of Ptolemy's geography, with a commentary, in which he first proposed the method of finding the longitude at sea by observing the moon's distance from the fixed stars. Werner died in 1528, aged sixty.

42. Nicolaus Copernicus rose next, and made so great a figure in astronomy, that the true system discovered, or rather renewed by him, has been ever since styled the Copernican. He restored the old Pythagorean system of the world, which had been set aside from the time of Ptolemy. About A. D. 1507 he conceived doubts of the Ptolemaic system, and entertained notions about the true one, which he gradually improved by a series of astronomical observations, and the study of former authors. By these he formed new tables, and completed his work in 1530, containing a renovation of the new system of the universe, in which all the planets are considered as revolving about the sun. This work was printed in 1543, under the care of Schoner and Osiander, by the title of *Revolutiones Orbium Cælestium*; and the author received a copy of it a few hours before his death, on the 23d of May 1543, he being then seventy years of age.

43. After the death of this great luminary of Astronomy, the science and practice of it were greatly improved by Schoner, Nonius, Gemma, Frisius, Rothmann, Byrgius, the landgrave of Hesse, &c. Schoner reformed and explained the calendar; improved the methods of making celestial observations; and published a treatise on cosmography. He died four years after Copernicus. Nonius wrote several works on mathematics, astronomy, and navigation, and invented some useful and more accurate instruments than formerly, one of these was the astronomical quadrant, on which he divided the degrees into minutes, by a number of concentric circles; the first was divided into ninety equal parts or degrees, the second into eighty-nine, the third into eighty-eight, and so on to forty-six; so that the index of the quadrant always falling upon or near one of the divisions, the minutes are known by an easy computation.

44. Appian's chief work, the *Cæsarean Astronomy*, was published at Ingolstadt in 1540; in which he shows how to observe the places of the stars and planets by the astrolabe; to resolve astronomical problems by certain instruments; to predict eclipses, and to describe the figures of them; and the method of dividing and using an astronomical quadrant. To these are added observations of five comets, one of which has been supposed the same with that observed by Hevelius, and if so, it ought to have returned again in the year 1789; but astronomers were disappointed in their expectations.

45. Gemma Frisius wrote a commentary on Appian's cosmography, accompanied with many observations of eclipses: he also invented the astronomical ring, and several other instruments useful in taking observations at sea; and was the first who recommended a time-keeper for determining the longitude. Rheticus began a very extensive work, being a table of sines, tangents, and secants, to a very large radius, and to every ten seconds, or one-sixth of a minute; which was completed by his pupil Valentine Otho, and printed in 1594.

46. William IV., landgrave of Hesse Cassel, applied himself to the study of astronomy about A. D. 1561; and, with the best instruments which could then be procured, made a great

number of observations, published by Snellius in 1618, and preferred by Hevelius to those of Tycho Brahe. From these observations he formed a catalogue of 400 stars, with their latitudes and longitudes, adapted to the beginning of the year 1593.

47. Tycho Brahe, a Danish nobleman, began his studies about the same time with the Landgrave of Hesse, and observed the great conjunction of Jupiter and Saturn; but, finding the usual instruments very inaccurate, he constructed many others much larger and more exact. In 1571 he discovered a new star in the chair of Cassiopeia; which induced him, like Hipparchus on a similar occasion, to make a new catalogue of the stars; which he composed to the number of 777, and adapted their places to the year 1600. In 1576, by the favor of the king of Denmark, he built his new observatory, called Uraniburg, on the small island Huenna, opposite to Copenhagen, which he very amply furnished with many large instruments, some of their arcs divided as to show single minutes, and in other the arch might be read off to ten seconds. The quadrant was divided according to the method invented by Nonius, that is by forty-seven concentric circles; but most of them were divided by diagonals; a method of division invented by Richard Chancellor, an Englishman. Tycho employed his time at Uraniburg to the best advantage, till the death of the king, when, falling into discredit, he was obliged to remove to Holstein: he afterwards introduced himself to the emperor Rodolph, with whom he continued at Prague till his death in 1601. Tycho was the inventor of a system of astronomy, a kind of semi-Ptolemaic, which he vainly endeavored to establish instead of the Copernican. His numerous works, however, show that he was a man of great abilities; and his discoveries, together with those of Purbach and Regiomontanus, were collected and published together in 1621, by Longomontanus, the favorite disciple of Tycho.

48. Tycho, while residing at Prague with the emperor, prevailed on Kepler to leave the university of Glatz, and to come to him; and Tycho dying in 1601, Kepler enjoyed all his life the title of mathematician to the emperor, who ordered him to finish the tables of Tycho Brahe, which he published in 1627, under the title of Rodolphine. He died about A. D. 1630, at Ratisbon, where he was soliciting the arrears of his pension. From his own observations and those of Tycho, Kepler discovered several of the true laws of nature, by which the motions of the celestial bodies are regulated. He discovered that all the planets revolve about the sun, not in circular, but in elliptical orbits, having the sun in one of the foci of the ellipse; that their motions are not equable, but varying, quicker or slower as they are near to the sun, or farther from him; that the areas described by the variable line drawn from the planet to the sun, are equal to equal times, and always proportional to the times of describing them; and that the cubes of the distances of the planets from the sun, were in the same proportion as the squares of their periodical times of revolution. By observations also on comets, he concluded that they are freely

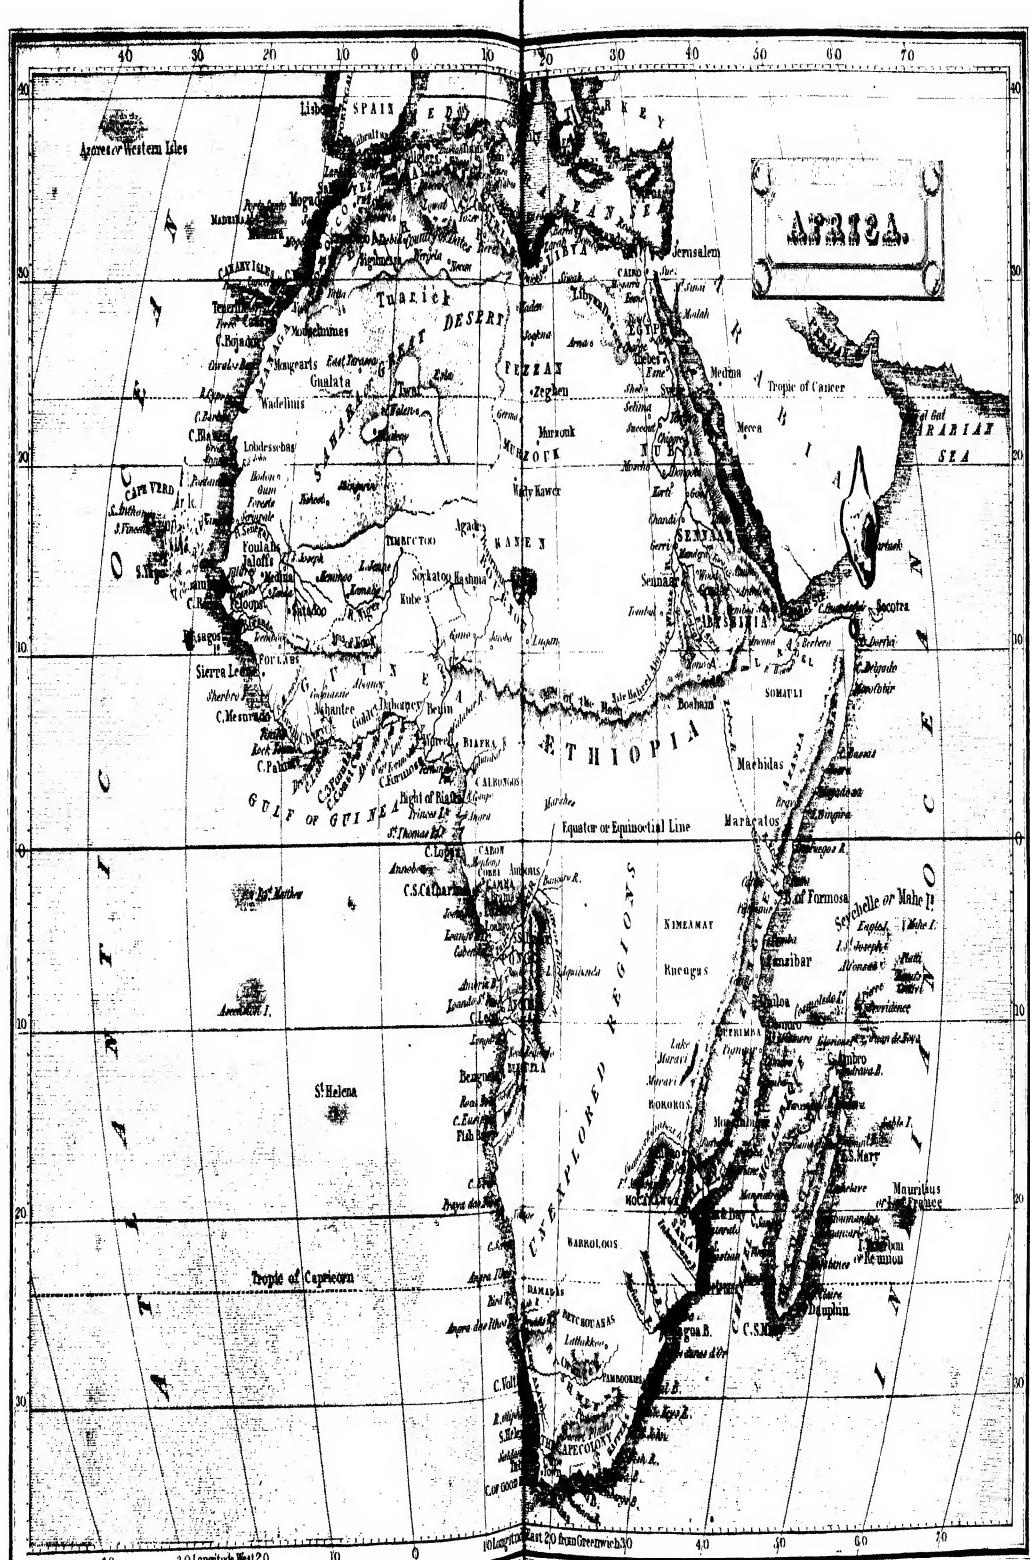

carried about among the orbits of the planets, in paths that are nearly rectilinear, but which he could not then determine.

49. At this time there were many other good proficients in astronomy; as Wright, Napier, Bayer, &c. Wright made several good meridional observations of the sun, with a quadrant of six feet radius, in the years 1594, 1595, and 1596; from which he greatly improved the theory of the sun's motion, and computed more accurately his declination, than any person had done before. In 1599 he published also, an excellent work, entitled, 'Certain Errors in Navigation discovered and detected,' containing a method which has commonly, though erroneously, been ascribed to Mercator. To Napier we owe some excellent theorems and improvements in spherics, besides the ever-memorable invention of logarithms. Bayer, a German, published his Uranometria, or the figures of all the constellations visible in Europe, with the stars marked on them, and accompanied by names, or the letters of the Greek alphabet; a contrivance by which they may easily be referred to with distinctness and precision.

50. About the same time, astronomy was cultivated abroad by Mercator, Maurolycus, Maginus, Homelius, Schultet, Stevin, Galileo, &c. and in England by Thomas and Leonard Digges, John Dee, Robert Flood, Harriot, &c. The beginning of the seventeenth century was particularly distinguished by the invention of telescopes, and the application of them to astronomical observations. The more distinguished early observations with the telescope, were made by Galileo, Harriot, Huygens, Hook, Cassini, &c. It is said that, from report only, Galileo made for himself telescopes, by which he discovered inequalities in the moon's surface, Jupiter's satellites, and the ring of Saturn; also spots on the sun, by which he found out the revolution of that luminary on its axis; and he discovered that the nebulae and milky way were full of small stars.

51. Mr. Harriot, who had previously been known only as an algebraist, made much the same discoveries as Galileo, and as early, if not more so, as appears by his papers in the possession of the earl of Egremont. And Mr. Horrox, a young astronomer of great talents, found out in 1633, that the planet Venus would pass over the sun's disc on the twenty-fourth of November 1639; an event which he announced only to his friend Crabtree; and these two were the only persons in the world that observed this transit. Horrox made also many other useful observations, and had even formed a new theory of the moon, taken notice of by Newton; but his early death, in the beginning of 1640, put a stop to his valuable labors.

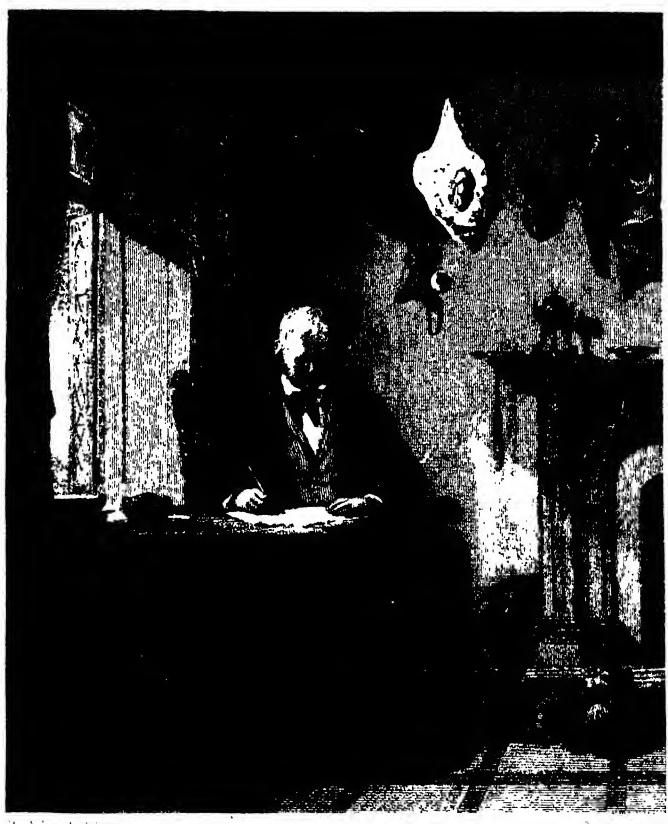

52. Hevelius, Burgomaster of Dantick, flourished about the same time, and observed the sun and phases of the moon; from which observations he compiled his Selenographia. An account of his apparatus is contained in his work entitled Machina Cælestis, a book now very scarce, as most of the copies were accidentally burnt, with the whole house and apparatus, in 1679. Hevelius died in 1688, aged 76.
